Text Mining of the Scientific Literature to Identify Pharmacogenomic Interactions Yael Garten, 2010 Pharmacogenomics is the study of how variation in the human genome impacts drug response in patients It is a major driving force of personalized medicine in which drug choice and dosing decisions are informed by individual information such as DNA genotype The field of pharmacogenomics is in an era of explosive growth massive amounts of data are being collected and knowledge discovered which promises to push forward the reality of individualized clinical care However this large amount of data is dispersed in many journals in the scientific literature and pharmacogenomic findings are discussed in a variety of non standardized ways It is thus challenging to identify important associations between drugs and molecular entities

particularly genes and gene variants. Thus these critical connections are not easily available to investigators or clinicians who wish to survey the state of knowledge for any particular gene drug disease or variant. Manual efforts have attempted to catalog this information; however, the rapid expansion of pharmacogenomic literature has made this approach infeasible. Natural Language Processing and text mining techniques allow us to convert free style text to a computable searchable format in which pharmacogenomic concepts such as genes, drugs, polymorphisms, and diseases are identified and important links between these concepts are recorded. My dissertation describes novel computational methods to extract and predict pharmacogenomic relationships from text. In one project we extract pharmacogenomic relationships from the primary literature using text mining. We process information at the fine grained sentence level using full text when available. In a second project we investigate the use of these extracted relationships in place of manually curated relationships as input into an algorithm that predicts pharmacogenes for a drug of interest. We show that for this application we can perform as well with text mined relationships as with manually curated information. This approach holds great promise as it is cheaper, faster, and more scalable than manual curation. Our method provides us with interesting drug gene relationship predictions that warrant further experimental investigation. In the third project we describe knowledge inference in the context of pharmacogenomic relationships. Using cutting edge natural language processing tools and automated reasoning we create a rich semantic network of 40,000 pharmacogenomic relationships distilled from 17 million Medline abstracts. This network connects over 200 entity types with clear semantics using more than 70 unique types of relationships. We use this network to create collections of precise and specific types of knowledge and infer relationships not stated explicitly in the text but rather inferred from the large number of related sentences found in the literature. This is exciting because it demonstrates that we are able to overcome the heterogeneity of written language and infer the correct semantics of the relationship described by authors. Finally we can use this network to identify conflicting facts described in the literature to study change in language use over time and to predict drug drug interactions. These achievements provide us with new ways of interacting with the literature and the knowledge embedded within it and help ensure that we do not bury the knowledge embodied in the publications but rather connect the often fragmented and disconnected pieces of knowledge spread across millions of articles in hundreds of journals. We are thereby brought one step closer to the realization of personalized medicine and ensure that as scientists we continue to build on the knowledge discovered by past generations and truly to stand on the shoulders of giants.

**30-Second Genetics** Jonathan Weitzman, Matthew Weitzman, 2020-03-31 This whistlestop guide teaches you everything you need to know about the fascinating science of genetics. Genetics is the study of heredity and reveals how the characteristics of living organisms are determined by the genes passed down the generations. In humans it can determine how we think, who we are, and how long we live. The human genome was mapped in 2003 and this enhanced ability to study our genes is transforming medicine from CRISPR, the gene editing technology that allows us to alter the course of hereditary

disease to using genetics to identify the types of bacteria that populate our bodies Stripping the subject to its bare necessities 30 Second Genetics charts the most extraordinary discoveries from the fundamentals of cell biology to the almost unbelievable advances in DNA sequencing and stem cell technology Each subject concept or term is explored in a mere 30 seconds 300 words and one image making this the perfect book to understand the field of genetics at lightening speed Authors and identical twin brothers Jonathan and Matthew Weitzman are both expert professors in the field and they write with clarity exploring these complicated terms in easy to understand language From advances in stem cell therapy to animal cloning genetically modified crops and genetically tailored treatments the Weitzman brothers demystify this essential science which is shaping our future today

**Applying an Implementation Science Approach to Genomic Medicine** National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Health Sciences Policy, Roundtable on Translating Genomic-Based Research for Health, 2016-08-06 Although it is becoming increasingly more common for clinicians to use genomic data in their practices for disease prevention diagnosis and treatment the process of integrating genomic data into the practice of medicine has been a slow and challenging one Some of the major barriers impeding the incorporation of new genomic technology into clinical practice are the difficulty of changing routine medical practices to account for the use of genetic testing the limited knowledge of patients and providers about genomic medicine assessing sufficient evidence to support the use of genetic tests privacy and data security issues and uncertainty about reimbursement The field of implementation science may be able to provide insights concerning efficient ways to incorporate genomic applications into routine clinical practice The focus of implementation science studies is to identify integration bottlenecks and optimal approaches for a given setting and ultimately to promote the up take of research findings To explore the potential of implementation science to improve the integration of genomics into medicine the National Academies of Sciences Engineering and Medicine held a workshop in Washington DC in November 2015 Participants explored the challenges and opportunities of integrating genomic advances into the clinic through the lens of implementation science This report summarizes the presentations and discussions from the workshop
