### **Optimization of Aircraft Arrival Operations for Improved Environmental Efficiency** Henrik Hardell,2024-04-16

The transportation sector accounting for about one fifth of all greenhouse gas emissions is facing a significant transformation in order to become more climate friendly In terms of air transportation there are several important steps on the way to making flying sustainable both for the planet itself and for people directly or indirectly being exposed to its effects In the state of the current air traffic operations where environmentally friendly propulsion systems and fuels are not yet implemented on a large scale enhancing the efficiency in the airspace can help to bring us closer to the environmental goals of aviation Such solutions may include improved synchronization of arriving flights in the Terminal Maneuvering Area TMA in which congestion is a problem for many airports In this thesis we first explore and develop methodologies for assessing the environmental impact of the operations in TMA More specifically the goal of the assessments is to quantify the additional fuel consumption gaseous emissions and noise that comes from horizontally and vertically inefficient arrival operations in TMA We perform our assessments on a couple of European airports including Stockholm Arlanda Secondly we propose a Mixed Integer Programming MIP based optimization model which provides for conflict free arrival operations where aircraft fly fuel efficient Continuous Descent Operations CDOs applied to Point Merge PM arrival procedures with the primary purpose to serve as a route assigner We base our optimization on real scenarios from actual transmitted flight data and model realistic descent profiles considering the operational capabilities of the specific aircraft type Additionally the optimization model ensures the required spacing between aircraft taking off and landing in case the runway is used in a mixed mode We evaluate our solutions by assessing numerous performance metrics including environmental efficiency and compare to the actual trajectories of the real operations On two European airports implementing PM procedures we demonstrate that our optimization model provides improved vertical performance as well as reduced time and distance flown in TMA contributing to reduced levels of noise and fuel savings accompanied by decreased emissions
