, **Cantigas de Santa Maria, de Don Alfonso El Sabio** Alfonso X (King of Castile and Leon), 1889 An Elementary Grammar of the Italian Language Antonio Marinoni, 1911 *Marginal Voices* Amy I. Aronson-Friedman, Gregory B. Kaplan, 2012-02-03 The conversos of late medieval and Golden Age Spain were Christians whose Jewish ancestors had been forced to change faiths within a society that developed a preoccupation with pure Christian lineage The aims of this book is to shed new light on the cultural impact of this social climate in which public suspicion of the religious sincerity of conversos became widespread and scrutiny by the Inquisition came to impede social advancement and threaten life and property The bulk of the essays center on literary works including lesser known and canonical pieces which are analyzed by scholars who reveal the heterogeneous nature of textual voices that are informed by an awareness of the marginal status of conversos Contributors are Gregory B Kaplan Ana Benito Patricia Timmons David Wacks Bruce Rosenstock Laura Delbrugge Michelle Hamilton Deborah Skolnik Rosenberg Kevin Larsen and Luis Bejarano **Christian-Muslim Relations. Volume 9 Western and Southern Europe (1600-1700)** ,2017-12-05 Christian Muslim Relations a Bibliographical History 9 CMR 9 covering Western and Southern Europe in the period 1600 1700 is a further volume in a general history of relations between the two faiths from the seventh century to the early 20th century It comprises a series of introductory essays and also the main body of detailed entries which treat all the works surviving or lost that have been recorded These entries provide biographical details of the authors descriptions and assessments of the works themselves and complete accounts of manuscripts editions translations and studies The result of collaboration between numerous leading scholars CMR 9 along with the other volumes in this series is intended as a basic tool for research in Christian Muslim relations Section Editors Clinton Bennett Luis F Bernab Pons Jaco Beyers Karoline Cook Lejla Demiri Martha Frederiks David D Grafton Stanis aw Grod Alan Guenther Emma Loghin Gordon Nickel Claire Norton Reza Pourjavady Douglas Pratt Radu P un Peter Riddell Umar Ryad Mehdi Sajid Cornelia Soldat Karel Steenbrink Davide Tacchini Ann Thomson Carsten Walbiner **Diccionario Manual Enciclopédico Ilustrado de la Lengua Castellana...** Saturnino Calleja y Fernandez, 1919 **Reading, Writing, and Errant Subjects in Inquisitorial Spain** Mr Ryan Prendergast, 2013-05-28 Reading Writing and Errant Subjects in Inquisitorial Spain explores the conception and production of early modern Spanish literary texts in the context of the inquisitorial socio cultural environment of the sixteenth and seventeenth centuries Author Ryan Prendergast analyzes instances of how the elaborate censorial system and the threat of punishment that both the Inquisition and the Crown deployed did not deter all writers from incorporating confronting and critiquing legally sanctioned practices and the exercise of institutional power designed to induce conformity and maintain orthodoxy The book maps out how texts from different literary genres scrutinize varying facets of inquisitorial discourse and represent the influence of the Inquisition on early modern Spanish subjects including authors and readers Because of its incorporation of inquisitorial scenes and

practices as well as its integration of numerous literary genres Don Quixote serves as the book's principal literary resource The author also examines the Moorish novel la novela morisca with special attention to the question of the religious and cultural Others in particular the Muslim subject the Picaresque novel la novela picaresca focusing on the issues of confession and punishment and theatrical representations and dramatic texts which deal with the public performance of ideology The texts which had differing levels of contact with censorial processes ranging from complete prohibition to no censorship incorporate the issues of control intolerance and resistance Through his close readings of Golden Age texts Prendergast investigates the strategies that literary characters many of them represented as legally or socially errant subjects utilize to negotiate the limits that authorities and society attempt to impose on them and demonstrates the pervasive nature of the inquisitorial specter in sixteenth and seventeenth century Spanish cultural production "The" Life of Miguel de Cervantes Saavedra James Fitzmaurice. Kelly, 1892 Landscapes and Landforms of Spain Francisco Gutiérrez, Mateo Gutiérrez, 2014-04-18 The Landscapes and Landforms of Spain provides an informative and inviting overview of the geology and geomorphology of Spain It incorporates a diverse range of topics ranging from the fiery landscapes of the Canary Islands and its volcanic formations to the glacial scenery of the Pyrenees The book devotes attention to granite landforms karst terrains coastal dunes and marshes as well as to heritage and conservation with the objective of offering the reader a comprehensive insight into the Spanish geological setting The book presents readers with the opportunity to explore Spanish landforms in detail through its highly illustrated pages and maps making this an appealing text on the subject field

Elliott, Sonia Chamizo, Vincent John Martin Noah Linus Felde, Andrew David Thomas, 2024-08-09 Biological soil crusts biocrusts are widely distributed throughout the world and cover approximately 12% of the terrestrial surface Biocrusts are composed of cyanobacteria algae lichens mosses and a great diversity of other microorganisms which bind soil particles together to form a layer of biological soil matrix on the soil surface typically of several millimetres thickness They are important sites of regional and global microbial diversity and perform multiple ecological functions multifunctionality During the evolution of terrestrial life on earth biocrusts are regarded as the main colonising photosynthetic organisms before the advent of vascular vegetation They not only represent the early stages of terrestrial ecosystems but also facilitate the ecosystem's development and succession Therefore biocrusts are recognised as ecological engineers in the natural development of ecosystems and for the

restoration of degraded terrestrial ecosystems The development of biocrusts is highly heterogeneous which is reflected on both temporal and spatial scales and this heterogeneity is still clearly visible even in a small scale However up to now only limited knowledge is acquired on biocrust temporal and spatial organisation In particular there still is a large knowledge gap regarding the various biocrust communities under different developmental states and their related physiological metabolisms and ecological functions Therefore in depth studies of these issues will undoubtedly further promote our understanding of the heterogeneous development of biocrusts as well as their ecological multifunctionality in terrestrial ecosystems The relevant contributions are expected to provide a scientific basis for the management of biocrusts and technology development e g cyanobacteria induced biocrust technology for ecological restoration and the promotion of soil health

The role of physical and biological soil crusts on the water balance in semiarid ecosystems Sonia Chamizo de la Piedra ,2014-11-06 In arid and semiarid areas the interplant spaces are usually covered by physical and biological soil crusts These crusts though representing an almost negligible portion of the soil profile have a number of crucial roles Soil crusts form the boundary between soil and atmosphere and therefore control gas water and nutrient exchange into and through soils Concretely in the last decade the study of biological soil crusts BSCs complex communities of cyanobacteria algae fungi lichens mosses and other microorganisms in intimate association with soil particles has drawn the attention of a growing number of researchers due to the key role they play in numerous processes in the ecosystems where they appear Unlike physical crusts BSCs protect soils against erosion by water and wind and increase soil fertility by fixing atmospheric C and N synthesising polysaccharides and reducing nutrient losses by runoff and erosion Through their influence on numerous properties that affect how water moves through soils such as roughness porosity hydrophobicity cracking and albedo BSCs play a key role in water processes such as infiltration and runoff evaporation and soil moisture It is widely known the role of physical crusts in decreasing soil porosity and hydraulic conductivity thus decreasing infiltration However there is controversy regarding the role of BSCs in infiltration and runoff processes Some studies indicate that BSCs increase infiltration and consequently decrease runoff whereas others have reported that they decrease infiltration and increase runoff or that they have no effect on either of them In addition the influence of BSCs on other soil water balance components such as evaporation and soil moisture has hardly been studied and the scarce existing studies also show contradicting results With the aim of enlightening the role that BSCs play in the water balance in semiarid areas in this thesis it has been analysed the influence of different soil crust types physical crusts and various developmental stages of BSCs on key soil water balance components such as infiltration runoff evaporation and soil moisture at plot scale Furthermore to better understand how these crusts affect hydrological processes the influence of the type of crust and developmental stage of the crust on different properties that affect water movement and retention in soils has been analysed Last spectral characteristics of the different crust types as well as of vegetation have been examined with the aim of developing a spectral classification system for

differentiation of these common ground covers in semiarid areas that allows their mapping and the modelling of the effects of the crusted areas on hydrological and erosion processes on larger spatial scales hillslope and catchment To conduct this research two areas where BSCs are widespread and that represent key spatial distributions of BSCs in semiarid ecosystems were chosen in the province of Almeria SE Spain El Cautivo in the Tabernas Desert a badlands catchment with silty loam textured soils and Las Amoladeras in the Cabo de Gata N jar Natural Park a flat area with sandy loam textured soils Our results show that BSCs increase aggregate stability water retention capacity and organic carbon and total nitrogen content compared to physical crusts and within BSCs these properties increase in the crust and the underlying soil as the crust is more developed in terms of greater biomass and later successional species composition The increase in soil properties with the presence of BSCs is especially noticeable in the top layer of soil 0 01 m and decreases with depth 0 01 0 05 m Chapter I Through their effect increasing surface roughness and physico chemical soil properties BSCs increase infiltration and decrease runoff compared to physical crusts In general infiltration increases with greater BSC development Chapter II However there are exceptions to this general pattern that are conditioned by other factors such as the spatial scale under study or the type of rainfall At small plot sizes 0 25 m² and after 1h high intensity simulated rainfall 50 mmh⁻¹ we found that well developed BSCs such as lichens generate higher runoff rates than less developed BSCs as cyanobacteria and similar runoff rates to physical crusts Chapter II Thus at microplot scales and under extreme events the effect of well developed BSCs in enhancing infiltration due to their greater roughness can be overcome by their ability to clog soil pores when wet thus increasing runoff However when the influence of BSCs on infiltration and runoff is analysed under natural rain events and at larger spatial scales 1 10 m² we found that in low intensity rainfalls runoff decreases with the cover of well developed BSCs lichens and this effect is higher as the plot size increases Chapter III Such decrease in runoff with the presence of well developed BSCs is due to the microtopography that these crusts confer to soils Under high intensity rainfalls BSC cover has no significant effect on runoff yield and the main factor acting to determine runoff generation is rainfall intensity Chapter III The removal of the crust initially causes infiltration to increase But this effect diminishes over time as raindrop impact reseals the surface and a new physical crust is formed that increases runoff Chapter II Moreover crust disturbance by trampling but especially by removal causes a dramatic increase in erosion Chapter II Erosion also depends on the type of BSC Well developed crusts as lichens and mosses generate lower erosion rates than less developed crusts as cyanobacteria Regarding the influence of BSCs on soil evaporation under saturation conditions and warm ambient temperatures soil water loss is quick in all types of surfaces and no significant differences are found in soils with or without BSCs Chapter V However during long cold wet periods soil water loss is faster in soils devoid of BSCs than in those covered by them Thus BSC crusted soils maintain more soil moisture at the upper soil layer 0 03 m than adjacent soils where the BSC has been removed during wet periods At deeper soil 0 10 m soil moisture is similar in both BSC crusted and uncrusted soils The removal of the BSC

causes a higher decrease in soil moisture in fine textured soils Cautivo where the presence of BSCs has a stronger influence on increasing porosity and infiltration than in coarse textured soils Las Amoladeras During dry soil periods soil moisture is similar in soils with or without BSCs Chapter V Last a quantitative analysis of spectral characteristics of vegetation physical crusts and BSC developmental stages has demonstrated the possibility of classifying these common ground covers in semiarid areas based on distinctive spectral features Chapter VI The application of the classification system developed to multi and hyperspectral provides the possibility for future mapping of spatial distribution and temporal dynamics of BSCs which is crucial to incorporating the effects of crusted surfaces in current hydrological and erosion models Summarizing compared to physical crusts the presence of BSCs increase physico chemical properties of underlying soils especially in the first centimeters of soil and this enhancement is greater as the BSC is more developed Due to this increase in soil properties and the higher roughness that BSCs provide to soils BSCs increase water input by increasing infiltration and soil moisture and soil moisture and reduce water output by reducing soil evaporation Hence compared to physical crusts the presence of BSCs and especially the presence of well developed BSCs have an overall positive effect on the local water balance in semiarid ecosystems in addition to having a major role in protecting soils from erosion
