Ethical issues in biomedical research and publication

Research and publication play a very vital role in progress of sciences in any field. Therefore, it is heartening to note that volume of research and publication of scientific data has increased manifold in the past two decades in dental sciences. Not only the print copies but also free online journals have made publication of this enormous volume of scientific data and literature possible. Earlier few international and national journals are now substituted with regional, state, and local level journals and various other publications sponsored by large dental manufacturing companies. Apart from this, recently many dental colleges have started publishing their own in-house journal to provide a platform to their own faculty and students to publish their work.

As publication of scientific papers is now linked to professional career upgradation as per the new DCI rule, the pressure for publication of papers is tremendous. Also, the number of postgraduate seats in various dental colleges, specially the private dental colleges, has increased very significantly in the past 7–10 years. Not only the student:teacher ratio is grossly inadequate, often the postgraduate teachers lack adequate experience themselves and time to guide the students into research design, its execution, analysis, and more importantly, into research norms and ethics.

In this current scenario, there is a real danger of compromising the scientific quality of research papers. There is increased temptation to deviate from the ethical norms for research and publication.

Hence, it is felt that awareness needs to be generated among scientific community: teachers, postgraduate, and graduate students and professionals engaged in sponsored or self-sponsored research about what constitutes "research misconduct" and "deviations," so that one can guard against these and follow the ethical norms while perusing research/publication as well as while reviewing articles submitted for editorial review.

"Ethics" in simple terms is defined as "norms for conduct" that distinguishes between acceptable and unacceptable behavior. Though ethical norms are learnt since childhood at home, school, religious places, etc., it is influenced throughout the life, impacted by various life experiences which explains the large variations in interpretation of ethical norms among individuals.^[1]

Ethical norms related to biomedical research and publication are laid down by various national and

international agencies. Some of these are as follows: (i) National Institute of Health, (ii) National Science Foundation, (iii) FDA, etc. The Nuremberg Code and Declaration of Helsinki by World Medical Association is the landmark in ethical standards followed the world over for biomedical research and uniform requirements for manuscripts submitted to biomedical journals (formulated by International Committee of Medical Journal Editors) for publication in biomedical journals.

Basically, the ethical norms comprise honesty, integrity, and social responsibility in very general common sense. But in relation to biomedical research and publication, it has several perspectives for which a researcher needs to be knowledgeable and sensitive. Some of these are highlighted below:

- (i) Careful approach to research design, data collection and interpretation.
- (ii) Maintaining confidentiality of research subjects and personnel records.
- (iii) Always acknowledging the source; using scientific materials without acknowledging the source amounts to plagiarism.
- (iv) Aim to advance knowledge and research and not one's career. Avoid temptation for duplicate publication of the same research in different journals or in different languages, without proper declaration to the effect.
- (v) Protect the subjects/patients included in the research study, minimizing risks and maximizing benefits, specially the vulnerable population. Informed consent of the patient/guardian (in the case of minors) in the presence of witness is absolutely essential to protect the interests of the human subjects enrolled in the study.
- (vi) Design animal experiments only if absolutely necessary and meaningful. Show proper care and compassion and minimize pain and suffering during the experiments.
