Energy Landscapes Inherent Structures And Condensed Matter Phenomena:

Energy Landscapes, Inherent Structures, and Condensed-Matter Phenomena Frank H. Stillinger, 2015-11-17 This book presents an authoritative and in depth treatment of potential energy landscape theory a powerful analytical approach to describing the atomic and molecular interactions in condensed matter phenomena Drawing on the latest developments in the computational modeling of many body systems Frank Stillinger applies this approach to a diverse range of substances and systems including crystals liquids glasses and other amorphous solids polymers and solvent suspended biomolecules Stillinger focuses on the topography of the multidimensional potential energy hypersurface created when a large number of atoms or molecules simultaneously interact with one another He explains how the complex landscape topography separates uniquely into individual basins each containing a local potential energy minimum or inherent structure and he shows how to identify interbasin transition states saddle points that reside in shared basin boundaries Stillinger describes how inherent structures and their basins can be classified and enumerated by depth curvatures and other attributes and how those enumerations lead logically from vastly complicated multidimensional landscapes to properties observed in the real three dimensional world Essential for practitioners and students across a variety of fields the book illustrates how this approach applies equally to systems whose nuclear motions are intrinsically quantum mechanical or classical and provides novel strategies for numerical simulation computations directed toward diverse condensed matter systems **Energy**

Heat Carriers in Liquids: An Introduction Jaeyun Moon, 2024-03-19 This book provides a succinct overview of recent progress in characterization of heat carriers describing atomic motion in liquids Unlike solids and gases where heat carriers are typically described by phonons and real atomic particles the nature of effective heat carriers in liquids is still elusive The emphasis is on two widely used spectral methods to describe heat carriers instantaneous normal modes and velocity autocorrelation functions Various bulk materials properties from a bottom up perspective using these spectra are presented in detail This book is an ideal introduction to the field for graduate students and young researchers

Isayev, 2016-06-07 A complete and timely overview of the topic this Encyclopedia imparts knowledge of fundamental principles and their applications for academicians scientists and researchers while informing engineers industrialists and entrepreneurs of the current state of the technology and its utilization The most comprehensive source on polymer blends available on the market Offers a complete and timely overview of the topic Each article presents up to date research development on a topic and its basic principles and applications integrates case studies laboratory and pilot plant experiments and gives due reference to published and patented literature Equips academics scientists and researchers with knowledge of fundamentals principles and their applications and informs the engineers industrialists and entrepreneurs about the state of the art technology and its applications **Annales** K. Mäkinen, Suomalainen Tiedeakatemia, Pentti

Paalassalo, J. Teuho, 1976 *Local Energy Landscape in a Simple Liquid*, 2014 It is difficult to relate the properties of liquids and glasses directly to their structure because of complexity in the structure that defies precise definition The potential energy landscape PEL approach is a very insightful way to conceptualize the structure property relationship in liquids and glasses particularly the effect of temperature and history However because of the highly multidimensional nature of the PEL it is hard to determine or even visualize the actual details of the energy landscape In this article we introduce a modified concept of the local energy landscape LEL which is limited in phase space and demonstrate its usefulness using molecular dynamics simulation on a simple liquid at high temperatures The local energy landscape is given as a function of the local coordination number the number of the nearest neighbor atoms The excitation in the LEL corresponds to the so called beta relaxation process The LEL offers a simple but useful starting point to discuss complex phenomena in liquids and glasses
