Ocean Artificial Upwelling - Ecological Responses and Biogeochemical Impacts Ulf Riebesell,Javier Arístegui,Nina

Bednarsek,Angelique White ,Ricardo Maria Letelier,2024-09-20 Feeding a growing human population and achieving net zero CO₂ emissions by 2050 are the great challenges of the 21st century Whilst terrestrial resources are already utilized intensively by competing societal sectors the vast ocean ecosystems still hold untapped potential The productivity of the ocean is however limited by the transport of nutrient rich deep waters to the sun lit surface layer In large parts of the global ocean this transport is blocked by a temperature induced density gradient with warm light waters residing on top of heavier cold waters The upward transport of nutrient rich deep waters through artificial upwelling can break this blockade and enhance primary production However little is presently known about the ecological responses to forced upwelling in oligotrophic waters their impacts on biogeochemical cycling and possible feedbacks to the climate system In view of its potential contribution to securing marine food production and mitigating climate change a comprehensive assessment of the feasibility effectiveness and associated risks of artificial upwelling is of particular scientific and societal interest

Membranes for Energy Applications Maria Giovanna Buonomenna,2022-01-22 There is a growing need for better

membranes in several emerging application fields especially those related to energy conversion and storage as well as to water treatment and recycling Processability is an important functional property often ignored especially in the early discovery phase for new materials but it should be one of the most important properties that needs to be considered in the development of better membrane materials Useful membrane materials have to be capable of being formed into thin membranes in particular for membrane gas separation water treatment and desalination and then packaged into large area membrane modules All gas separation membranes that are in current commercial use are based on polymers which are solution processable This book intends to deal with composite in most cases hybrid polymer based membranes for three separate application fields energy conversion energy storage and water treatment and recovery Each chapter will explain clearly the various membrane processes then go on to discuss in detail the corresponding advanced membranes used The logic that lies behind this is that you have to understand the process in order to develop new high performance membranes By taking this approach the author aims to overcome the disconnection that currently exists between membrane materials scientists and industrial process engineers Discusses interdisciplinary content by a single author approaching synthesis and development of materials from the perspective of their processability Describes the novel aspects of membrane science that is related to energy storage conversion and wastewater treatment Presents an emphasis on scientific results which have an impact on real applications in terms of renewable and clean energy challenges Publications of the National Bureau of Standards ...
