**Simulating the Mind** Dietmar Dietrich, Georg Fodor, Gerhard Zucker, Dietmar Bruckner, 2010-01-12 Can psychoanalysis offer a new computer model Can computer designers help psychoanalysts to understand their theory better In contemporary publications human psyche is often related to neural networks Why The wiring in computers can also be related to application software But does this really make sense Artificial Intelligence has tried to implement functions of human psyche The reached achievements are remarkable however the goal to get a functional model of the mental apparatus was not reached Was the selected direction incorrect The editors are convinced yes and they try to give answers here If one accepts that the brain is an information processing system then one also has to accept that computer theories can be applied to the brain's functions the human mental apparatus The contributors of this book Solms Panksepp Sloman and many others who are all experts in computer design psychoanalysis and neurology are united in one goal finding synergy in their interdisciplinary fields

**Bio A.I. - From Embodied Cognition to Enactive Robotics** Adam Safron, Inês Hipólito, Andy Clark, 2023-12-08 Even before the deep learning revolution the landscape of artificial intelligence AI was already changing drastically in the 90s Embodied intelligence it was proposed must play a crucial role in the design of intelligent machines This new wave was inspired by what is today known as Embodied and Enactive Cognitive Science or E Cognition which considers that cognitive activity does not reduce to the intellectual capacities of agents being able to represent their environments E cognition set AI and robotics in a new direction in which intelligent machines are required to interact with the environment and where this interaction does not reduce to explicit representations or prespecified algorithms These ideas revolutionized the way we think about intelligent machines and cognition but these theoretical advances are only partially reflected in modern approaches to AI and machine learning ML Despite deeply impressive achievements AI ML still struggles to recapitulate the kinds of intelligence we find in natural systems whether we are considering individual insects e.g simultaneous localization and mapping or swarm behaviour e.g. foraging sensing and ensemble inferences and especially the kinds of flexibility and high level reasoning characteristic of human cognition

**Robot Souls** Eve Poole, 2023-08-01 Two of the biggest design problems in Artificial Intelligence are how to build robots that behave in line with human values and how to stop them ever going rogue One under

explored solution to these alignment and control problems might be to examine how these are already addressed in the design of humans Looking closely at the human blueprint it contains a suite of capacities that are so clumsy they have generally been kept away from AI It was assumed that robots with features like emotions and intuition that made mistakes and looked for meaning and purpose would not work as well as robots without this kind of code But on considering why all these irrational properties are there it seems that they emerge from the source code of soul Because it is actually this junk code that makes us human and promotes the kind of reciprocal altruism that keeps humanity alive and thriving Robot Souls looks at developments in AI and reviews the emergence of ideas of consciousness and the soul It places our junk code in this context and argues that it is time to foreground that code and to use it to look again at how we are programming AI The book author Eve Poole received an OBE in the 2023 New Year Honours for services to education and gender equality [AI and Developing Human Intelligence](#) John Senior,Éva Gyarmathy,2021-09-16 As the relationship between AI machines and humans develops we ask what it will mean to be an intelligent learner in an emerging socio dynamic learningscape The need for a new global view of intelligence and education is the core discussion of this future focussed collection of ideas questions and activities for learners to explore This fascinating guide offers activities to understand what needs to be changed in our education systems and our view of intelligence As well as exploring AI HI the future of learning and caring for all learners this book addresses fundamental questions such as How do we educate ourselves for an increasingly uncertain future What is the purpose of intelligence How can a curriculum focussing on human curiosity and creativity be created Who are we and what are we becoming What will we invent now that AI exists AI and Developing Human Intelligence will interest you inform you and empower your understanding of intelligence and where we are going on the next part of our journey in understanding what it is to be human now and tomorrow **MEDINFO 2021: One World, One Health – Global**

*Extimate Technology* Ciano Aydin, 2021-01-21 This book investigates how we should form ourselves in a world saturated with technologies that are profoundly intruding in the very fabric of our selfhood New and emerging technologies such as smart technological environments imaging technologies and smart drugs are increasingly shaping who and what we are and influencing who we ought to be How should we adequately understand evaluate and appreciate this development Tackling this question requires going beyond the persistent and stubborn inside outside dualism and recognizing that what we consider our inside self is to a great extent shaped by our outside world Inspired by various philosophers especially Nietzsche Peirce and Lacan this book shows how the values goals and ideals that humans encounter in their environments not only shape their identities but also enable them to critically relate to their present state The author argues against understanding technological self formation in terms of making ourselves better stronger and smarter Rather we should conceive it in terms of technological sublimation which redefines the very notion of human enhancement In this respect the author introduces an alternative more suitable theory namely Technological Sublimation Theory TST *Extimate Technology* will be of interest to scholars and advanced students working in philosophy of technology philosophy of the self phenomenology pragmatism and history of philosophy The Open Access version of this book available at <http://www.taylorfrancis.com/books/9781003139409> has been made available under a Creative Commons Attribution Non Commercial

**Modularity in Motor Control: From Muscle Synergies to Cognitive Action Representation** Andrea d'Avella, Martin Giese, Yuri P. Ivanenko, Thomas Schack, Tamar Flash, 2016-04-21 Mastering a rich repertoire of motor behaviors as humans and other animals do is a surprising and still poorly understood outcome of evolution, development, and learning. Many degrees of freedom, non-linear dynamics, and sensory delays provide formidable challenges for controlling even simple actions. Modularity as a functional element, both structural and computational, of a control architecture might be the key organizational principle that the central nervous system employs for achieving versatility and adaptability in motor control. Recent investigations of muscle synergies, motor primitives, compositionality, basic action concepts, and related work in machine learning have contributed to advance, at different levels, our understanding of the modular architecture underlying rich motor behaviors. However, the existence and nature of the modules in the control architecture is far from settled. For instance, regularity and low dimensionality in the motor output are often taken as an indication of modularity, but could they simply be a byproduct of optimization and task constraints? Moreover, what are the relationships between modules at different levels, such as muscle synergies, kinematic invariants, and basic action concepts? One important reason for the new interest in understanding modularity in motor control from different viewpoints is the impressive development in cognitive robotics. In comparison to animals and humans, the motor skills of today's best robots are limited and inflexible. However, robot technology is maturing to the point at which it can start approximating a reasonable spectrum of isolated perceptual, cognitive, and motor capabilities. These advances allow researchers to explore how these motor, sensory, and cognitive functions might be integrated into meaningful architectures and to test their functional limits. Such systems provide a new test bed to explore different concepts of modularity and to address the interaction between motor and cognitive processes.

experimentally Thus the goal of this Research Topic is to review compare and debate theoretical and experimental investigations of the modular organization of the motor control system at different levels By bringing together researchers seeking to understand the building blocks for coordinating many muscles for planning endpoint and joint trajectories and for representing motor and behavioral actions in memory we aim at promoting new interactions between often disconnected research areas and approaches and at providing a broad perspective on the idea of modularity in motor control We welcome original research methodological theoretical review and perspective contributions from behavioral system and computational motor neuroscience research cognitive psychology and cognitive robotics
