Foundations of Fluid Mechanics with Applications Sergey P. Kiselev, Evgenii V. Vorozhtsov, Vasily M. Fomin, 2012-12-06 Fluid mechanics FM is a branch of science dealing with the investigation of flows of continua under the action of external forces The fundamentals of FM were laid in the works of the famous scientists such as L Euler M V Lomonosov D Bernoulli J L Lagrange A Cauchy L Navier S D Poisson and other classics of science Fluid mechanics underwent a rapid development during the past two centuries and it now includes along with the above branches aerodynamics hydrodynamics rarefied gas dynamics mechanics of multi phase and reactive media etc The FM application domains were expanded and new investigation methods were developed Certain concepts introduced by the classics of science however are still of primary importance and will apparently be of importance in the future The Lagrangian and Eulerian descriptions of a continuum tensors of strains and stresses conservation laws for mass momentum moment of momentum and energy are the examples of such concepts and results This list should be augmented by the first and second laws of thermodynamics which determine the character and direction of processes at a given point of a continuum The availability of the conservation laws is conditioned by the homogeneity and isotropy properties of the Euclidean space and the form of these laws is related to the Newton's laws The laws of thermodynamics have their foundation in the statistical physics
