

COGNITIVE PSYCHOLOGY

Cognitive psychology is the study of internal mental processes (how we think). Cognitive psychologists believe the mind works like a computer, with the ability to input, store and retrieve data, and individuals are seen as active processors of information. It is the way we perceive, anticipate, interpret and evaluate the events that have the greatest impact on our behaviour.

EYEWITNESS TESTIMONY

Eyewitness testimony is the evidence provided by people who witnessed an event or crime. It includes descriptions of criminals and crime scenes and relies on recall from memory.

Many factors can affect the accuracy of eyewitness testimonies.

Lofhus and Palmer (1974) studied eyewitness testimony and concluded that leading questions can affect the accuracy of people's memories of an event.

Welford and Cassin (1997) studied the effects of weapon presence on eyewitness testimony. They found that age affects eyewitness testimony, especially when children or elderly people are questioned.

Lofhus (1976) studied weapon focus in eyewitness testimony. She found that when weapons were present, witnesses often focused on central details such as a weapon at the expense of other peripheral details.

Gosselin et al. (1986) compared the cognitive interview technique to witness the accuracy of witness recall of events during police questioning.

The cognitive interview technique improves accuracy by doing the following:

- Recreating the environmental and personal context of the crime
- Reporting every detail of the witness can remember
- Recalling details of the crime in different orders
- Reporting the crime from different perspectives

RESEARCH METHODS

Cognitive psychologists adopt a scientific approach to measuring mental processes and use experimental designs where variables can be tested and controlled.

Cognitive psychologists use five main research methods:

- 1. Laboratory Experiments** - Experiments carried out in tightly controlled surroundings with specialist equipment
- 2. Field Experiments** - Experiments carried out in natural surroundings but the independent variable is still manipulated
- 3. Natural Experiments** - Experiments that involve examining naturally occurring situations that cannot be manipulated
- 4. Brain Imaging** - Techniques investigating how and where the brain's particular perceptual and cognitive processes occur (e.g. MRI scans, PET scans)
- 5. Case Studies** - In-depth investigation of an individual, group, event or community. E.g. individuals who have suffered brain damage (e.g. and Henry Molaison (1954) and Olive Weaving

STRENGTHS

- It is useful in understanding how the brain operates and its limitations.
- It is reliable because experiments can be repeated.
- Its related therapies are fast acting and have no side effects.

WEAKNESSES

- It ignores the role of emotion and influence from peers, so it does not sufficiently reflect real-world psychological and behavioural processes.
- It does not take individual differences into account and assumes that everyone processes information in exactly the same way.

MEMORY

Memories are believed to have a physical basis or trace.

There are three main types of memory:

- Sensory memory
- Short-term memory
- Long-term memory

Atkinson and Shiffrin (1968) created the multi-store model of memory. It describes memory as information flowing through a system.

1. Information from our environment is detected by our sensory organs and goes into the sensory memory.
2. If you think about this information or pay attention to it, it will be encoded and enter the short-term memory.
3. Short-term memory has a limited capacity and duration. If information is rehearsed, then it can be transferred to the long-term memory, where it can remain forever. If the information is not rehearsed, it is forgotten through the process of displacement or decay.

PERCEPTION

Our senses are constantly bombarded with information from the environment around us. The brain needs to be processed in order to make sense of it. This processing of information is known as perception.

Gibson's Direct Theory of Perception is a Bottom-Up Theory

This theory suggests that stimuli provide visual information that the cognitive system processes, allowing a person to make sense of the information. Gibson argues it is possible because of the large amount of information provided by the optic array.

Gregory's Indirect Theory of Perception is a Top-Down Theory

This theory suggests that stimuli do not provide enough information for the cognitive system to make sense of it. Instead stimuli are considered as hypotheses that are tested within different contexts using stored knowledge. Visual illusions provide support for this theory.

Depth perception is the ability to change a 2D image on the retina into 3D information using cues such as relative size, because gradients in colour flow patterns.

Size constancy occurs when the brain is able to identify an object as being closer rather than larger. The closer an object is, the larger the image it creates on the retina.

Shape constancy occurs when an object is rotated, changing the shape of it on the retina, but the brain recognises that the object has not changed shape.
