**Peripheral Nerve Disorders** Gérard Said, Christian Krarup, 2013-08-17 Disorders of the peripheral nervous system PNS are the cause of prominent neurological symptoms including weakness sensory loss pain and autonomic dysfunction associated with deficits morbidity and mortality These disorders may be primary hereditary or cryptogenic neurologic disorders confined to the PNS or part of the pathology of both the central nervous system and the PNS Most PNS disorders are secondary to other system disorders and may be responsive to treatment of the primary disease Important advances have been obtained in several areas including molecular genetics biochemistry immunology morphology and physiology that have enhanced our understanding of the causes and consequences of damage to peripheral nerve Understanding of both these groups of PNS diseases has greatly expanded over

recent years and has led to important advances of treatment both to protect and to repair damages of peripheral nerve This volume provides an overview of the state of the art of examination diagnosis and treatment of these very diverse disorders and will be of interest to both the research and clinical neuroscience and neurology communities Covers both hereditary and cryptogenic neurologic disorders Includes advances in the basic science of PNS from molecular genetics biochemistry immunology morphology and physiology Detailed coverage of neuropathy in connective tissue disorders infectious disorders metabolic disorders and malignancy Peripheral Nerve Disorders Guido Stoll,Einar Wilder-Smith,Martin Bendszus,2013-08-17 This chapter summarizes progress in the evaluation of peripheral nerve PN lesions and disorders by imaging techniques encompassing magnetic resonance imaging MRI and nerve ultrasound US Due to the radiation exposure and limited sensitivity in soft tissue contrast computed tomography CT plays no significant role in the diagnostic work up of PN disorders MRI and US are complementary techniques for the evaluation of peripheral nerves each having particular advantages and disadvantages Nerve injury induces intrinsic MRI signal alterations on T2 weighted sequences in degenerating or demyelinating nerve segments as well as in corresponding muscle groups exhibiting denervation which can be exploited diagnostically Nerve US is based on changes in the nerve echotexture due to tumor formation or focal enlargement caused by entrapment or inflammation Both MRI and US provide morphological information on the precise site and extent of nerve injury While US has the advantage of easy accessibility providing images with superior spatial resolution at low cost MRI shows better soft tissue contrast and better image quality for deep lying nerve structures since imaging is not hindered by bone Recent advances have remarkably increased spatial resolution of both MRI and US making imaging indispensable for the elucidation of causes of nerve compression peripheral nerve tumors and focal inflammatory conditions Both MRI and US further guide neurosurgical exploration and can simplify treatment Importantly imaging can reveal treatable conditions even in the absence of gross electrophysiological alterations illustrating its increasing role in clinical practice In experimental settings novel molecular and cellular MRI contrast agents allow in vivo assessment of nerve regeneration as well as monitoring of neuroinflammation Depending on further clinical development contrast enhanced MRI has the potential to follow cellular responses over time in vivo and to overcome the current limitations of histological assessment of nerve afflictions Further advances in contrast enhanced US has the potential for developing into a tool for the assessment of nerve blood perfusion paving the way for better assessments of ischemic neuropathies Cumulated Index Medicus ,1983 **Annals of Saudi Medicine** ,1990 **2008 Healthcare Standards Official Directory** ECRI Institute Staff,Ecri,2007-12
