Evolutionary Methods In Biotechnology Clever Tricks For Directed Evolution:

Evolutionary Methods in Biotechnology Susanne Brakmann, Andreas Schwienhorst, 2006-03-06 Minuturization and high throughput assay technology have brought the power of molecular evolution to the bioscience laboratory. Applied wisely, the evolutionary approach can quickly yield the desired result even where other methods have failed. From library generation by random or directed mutagenesis to screening and selection techniques, the crucial steps for successful evolutionary biotechnology are described in detail in this practical guide that also includes valuable troubleshooting hints on frequently encountered problems. Modern methods for the surface display of peptides and proteins, selective enrichment of nucleic acid aptamers, and high throughput screening of industrial biocatalysts are explained, and computer-based methods for *in silico* protein and RNA engineering are described as an alternative to *in vitro* approaches. A special section covers the patenting regulations with regard to biotechnological innovations derived from directed evolution. As an added bonus, a CD-ROM is included that contains software tools for library design, selection of mutagenesis positions, and various predictive algorithms. In short, this practice-oriented handbook is an indispensable tool for every scientist working in this interdisciplinary research area.

Biocatalysis in the Pharmaceutical and Biotechnology Industries Ramesh N. Patel, 2006-09-26 Because enzyme-catalyzed reactions exhibit higher enantioselectivity, regioselectivity, substrate specificity, and stability, they require mild conditions to react while prompting higher reaction efficiency and product yields. **Biocatalysis in the Pharmaceutical and Biotechnology Industries** examines the use of catalysts to produce fine chemicals.

Bio-inspired Catalysts Thomas R. Ward, 2009-02-05 In order to meet the ever increasing demands for enantiopure compounds heterogeneous homogeneous and enzymatic catalysis evolved independently in the past Although all three approaches have yielded industrially viable processes the latter two are the most widely used and can be regarded as complementary in many respects Despite the progress in structural computational and mechanistic studies however to date there is no universal recipe for the optimization of catalytic processes Thus a trial and error approach remains predominant in catalyst discovery and optimization With the aim of complementing the well established fields of

homogeneous and enzymatic catalysis organocatalysis and artificial metalloenzymes have enjoyed a recent revival Artificial metalloenzymes which are the focus of this book result from combining an active but unselective organometallic moiety with a macromolecular host Kaiser and Whitesides suggested the possibility of creating artificial metallozymes as long ago as the late 1970s However there was a widespread belief that proteins and organometallic catalysts were incompatible with each other This severely hampered research in this area at the interface between homogeneous and enzymatic catalysis Since 2000 however there has been a growing interest in the field of artificial metalloenzymes for enantioselective catalysis The current state of the art and the potential for future development are presented in five well balanced chapters G Roelfes B Feringa et al summarize research relying on DNA as a macromolecular host for enantioselective catalysis
