

Chapter: 18, Regulation of Gene Expression

Key Message/Theme of Chapter: The theme of Chapter 18 revolves around the regulation of gene expression through transcription and RNA processing and of gene regulation affects organisms and the environment in which they surround.

Vocab:

1. Corepressor: a small molecule that cooperates with a repressor protein to switch an operon off.
2. Histone acetylation: the addition of acetyl group to an amino acid is a histone tail and promotes transcription by opening up chromatin structure.
3. DNA Methylation: Different sets of enzymes can methylate DNA itself on certain bases, usually cytosine. This typically occurs in most plants, animals, and fungi.
4. MicroRNAs: small single stranded RNA molecules that are capable of binding to complementary sequences in mRNA molecules and allows the complex to bind to any mRNA molecule and can block the translation of the target mRNA.
5. SiRNAs: small non-coding RNAs that act in a similar manner to MicroRNAs. It is used to reduce the translation of specific messenger RNAs.

What was the most challenging material in the chapter? How would you explain it now?

The most difficult material in this chapter was operons. Operons are made of a promoter, operator, and DNA required for enzyme production. Operons can be repressible or inducible. The trp operon is always on, so it can be repressed. A repressor binds to the operator, which prevents RNA pol from transcribing the gene. Tryptophan acts as a corepressor because it works with a repressor protein to regulate gene expression. The lac operon is inducible. The natural state of the lac operon is off. When lactose enters a cell, lac-1 will code for a repressor protein that will turn off the operon. When all the lactose is hydrolyzed, then the repressor reattaches to the operator.

Test Questions:

In eukaryotes, DNA packing seems to affect gene expression by which of the following?	a) controlling access to DNA, b) turning certain genes on, c) enhancing the recombination of genes
What is the role of proteasomes?	a) they remove acetyl groups from histones, b) they are giant protein complexes that recognize ubiquitin and degrade the tagged proteins
Cells can influence each other's development by a process known as _____	a) apoptosis, b) induction, c) transduction

Major Processes (Draw it Out): Epigenetic changes to cells by virus causing cancer

How does this material relate to last week's material?

Major Themes of Last Week	How does it connect?
<ul style="list-style-type: none"> • Transcription • Translation • Mutations 	In chapter 17, we discussed mutations and how they can impact translation. This week we began discussing cancer and how it grows. Cancer occurs when multiple mutations occur within a cell. These mutations delete important genes, translocate the genes, or invert the genes. These mutations can lead to rapidly dividing cells that become cancerous.
