 The user can vary via Windows based input screens various amplifier characteristics such as fiber length, pump power, signal power and additional signals. The output is saved in a file which can be read by any spreadsheet or plotting package for graphical representation of the results. The software allows the reader to explore on his or her own the concepts of amplifier performance discussed in the book and gain a more intuitive and interactive educational experience leading to a richer understanding of erbium doped fiber amplifiers and their applications.

Spatially Integrated Erbium-doped Fiber Amplifiers Enabling Space-division Multiplexing

Cang Jin, 2016
 The exponential increase of communication bandwidth demand is giving rise to the so called capacity crunch expected to materialize within the next decade. Due to the nonlinear limit of the single mode fiber predicted by the information theory, all the state of the art techniques which have so far been developed and utilized in order to extend the optical fiber communication capacity are exhausted. The spatial domain of the lightwave links is proposed as a new degree of freedom that can be employed to increase the number of transmission paths and subsequently overcome the looming capacity crunch. Therefore the emerging technique named space division multiplexing (SDM) is a promising candidate for creating next generation optical networks. To realize SDM in optical fiber links one needs to investigate novel spatially integrated devices, equipment and subsystems. Among these elements the SDM amplifier is a critical subsystem in particular for the long haul transmission system. Due to the excellent features of the erbium doped fiber amplifier (EDFA) used in current state of the art systems, the EDFA is again a prime candidate for implementing practical SDM amplifiers. However, since the SDM introduces a spatial variation of the field in the transverse plane of the optical fibers, spatially integrated erbium doped fiber amplifiers (SIEDFA) require a careful design. In this thesis we firstly review the recent progress in SDM, in particular the SDM optical amplifiers. Next we identify and discuss the key issues of SIEDFA that require scientific investigation. After that the EDFA theory is briefly introduced and a corresponding numerical modeling that can be used for simulating the SIEDFA is

proposed Based on a home made simulation tool we propose a novel design of an annular based doping profile of few mode erbium doped fibers FM EDF and numerically evaluate the performance of single stage as well as double stage few mode erbium doped fiber amplifiers FM EDFA based on such fibers Afterward we design annular cladding erbium doped multicore fibers MC EDF and numerically evaluate the cladding pumped multicore erbium doped fiber amplifier MC EDFA based on these fibers as well In addition to fiber design we fabricate and characterize a multicore few mode erbium doped fiber MC FM EDF and perform the first demonstration of the spatially integrated optical fiber amplifiers incorporating such specialty doped fibers Finally we present the conclusions as well as the perspectives of this research In general the investigation and development of the SIEDFA will bring tremendous benefits not only for future SDM transmission systems but also for current state of the art single mode single core transmission systems by replacing plural amplifiers by one integrated amplifier

Design and Development of a Broadband Erbium Doped Fiber Amplifiers Aiman Mohemad Mohemad Kassir,2003

This thesis presents the research work that was carried out on the development characterization and analysis of broadband Erbium doped silica fiber amplifier B EDF Erbium doped fiber amplifiers provide advantages over regenerative repeaters as well as other amplification systems For example better crosstalk characteristics higher power operation lower insertion loss than semiconductor laser amplifiers higher efficiency than Raman amplifiers and low noise figure than Brillouin amplifiers In addition EDFAs are the only amplifier that can be used as both distributed and lumped amplifier in telecommunications Currently optical communication technology is moving from point to point systems to optical networking The exponential growth in data communications and the internet places urgent demands on high capacity communication networks To increase the total capacity amplifier bandwidth has commanded much attention However the spread and expansion of dense wavelength division multiplexing DWDM systems are keeping pace with various technology developments of optical amplifiers and in particular the bandwidth broadening of EDFAs For this thesis a novel EDF A structure is developed to increase the amplifier bandwidth by combining the conventional band and long wavelength band C L This will offer more efficient use of optical fiber networks and it will satisfy the demand of higher transmission capacity The design and development of EDFAs is viewed particularly from engineering perspective through double pass technique Single pass and double pass silica based Erbium doped fiber amplifier SP EDFA DP EDFA have been discussed in this thesis The performance of both systems is compared and presented thoroughly There are two approaches used in this thesis simulation and experiment work Simulation is designed to check and optimize the design parameters of the amplifier Efforts costs and time can be saved through software simulation process which are the benefits that make the simulation as an absolute option in the amplifier design Experiment is implemented after the optimization stage with both SP EDFA and DP EDFA systems As a conclusion results of both approaches will be presented in this thesis A bandwidth amplification of 90nm is obtained through a double pass technique This bandwidth can support more than 100 WDM channels with standard channel spacing of 100 Gbps All analysis and discussion will be presented

Becker, 2005-05-01 Erbium Doped Fiber Amplifiers Pumped in the 800 Nm Band Balakrishnan Sridhar, 1992 *Erbium-doped Fiber Amplifiers and Their System and Network Applications* Dan N. Chen, 1994 *Development of Thulium-Doped Fluoride Fiber Amplifiers* Marcin Michał Koźak, 2006 This thesis is related to

the spectroscopic and optical properties of doped optical fibers used as a laser amplifier for short laser pulses at high repetition rates emitting around 2 μm . Therefore short pulses created by a laser diode are amplified in thulium doped optical fibers combining the benefits of a direct electronic control of the laser diodes parameters and the robust setup of an optical fiber system that can easily be integrated. After the development of a high current pulse generator especially adapted to the 2 μm laser diodes used pulses of 7 ns with peak powers in the Watt range could be generated. Due to the modal behaviour of these laser diodes only 2 mW of peak power could be launched into a single mode fiber. By comparing different fiber glasses a heavy metal fluoride glass could be identified as the optimum host for the ions thulium and holmium emitting around 2 μm . Due to the development of a numerical simulation tool based on rate equations and radiation transport equations the fiber parameters such as core diameter fiber length etc could be optimized minimizing the amplified spontaneous emission ASE created inside the fiber. Based on this simulation a laser system consisting of cascaded fiber amplifiers could be realized. It emits short laser pulses 20–30 ns at high repetition rates up to 125 kHz and peak powers of up to 5 kW. In contrast to Q-switched lasers the pulse width created is independent of the repetition rate. By using these pulses at 1.87 μm as an optical pump for a Cr²⁺/ZnSe laser efficiencies of up to 22% could be reached at an emission wavelength of 2.5 μm . *Double-pass Erbium-doped Fiber Amplifiers* Wang Qi, 2004
