Prostate Cancer Methods and Protocols Pamela J. Russell, Paul Jackson, Elizabeth A. Kingsley, 2008-02-01 Prostate cancer is the second leading cancer in men in Western society A major concern and an area of intensive research involves understanding why certain prostate cancers remain localized or indolent whereas others become aggressive and metastasize The differences between these cancer types have profound implications for patients and physicians Indolent disease which grows very slowly generally does not cause any problems to the patient whereas aggressive disease requires immediate treatment the earlier the better At present there are no markers that discriminate between these two entities thus causing a dilemma for the management of patients who have recently been diagnosed The aim of Prostate Cancer Methods and Protocols is to explore cutting edge molecular methods that may have the potential to reveal markers of disease for use in more accurate diagnoses of prostate cancer and consequently to lead to new treatment strategies This book provides a comprehensive collection of both in vitro and in vivo step by step protocols currently used by leaders in prostate cancer research advice on approaches that can be used in the study of prostate cancer as well as reviews covering areas less amenable to laboratory research such as environmental factors in prostate cancer to provide the reader with an overview of the prostate cancer research field as it currently stands

Suicide Gene Therapy Caroline J. Springer, 2008-02-01 Gene therapy has expanded rapidly over the last decade The number of clinical trials reported by 2001 included 532 protocols and 3436 patients Phase I trials predominate with 359 trials of 1774 patients versus Phase II 57 trials with 507 patients and Phase III 3 trials of 251 patients The disease overwhelmingly targeted by gene therapy is cancer involving 331 trials with 2361 patients Despite the somewhat disappointing results of clinical trials to date gene therapy offers tremendous promise for the future of cancer therapy The area of gene therapy is vast and both malignant and nonmalignant cells can be targeted

Suicide Gene Therapy Methods and Reviews covers gene therapy that targets malignant cells in a treatment that has become known as suicide gene therapy Basically this approach uses the transduction of cancer cells with a gene for a foreign enzyme that when expressed is able to activate a nontoxic prodrug into a highly cytotoxic drug able to kill the cancer cell population This is a major area in cancer gene therapy in 2001 this technique was represented by 52 clinical protocols with a total of 567 patients Additional trials used multiple gene therapy protocols that also involved suicide gene therapy 83 with 497 patients indicating that the interest in this area is considerable Suicide Gene Therapy Methods and Reviews aims to cover comprehensively both in theoretical and practical terms the rapidly evolving area of suicide gene therapy for cancer

Novel Anticancer Drug Protocols John K. Buolamwini, Alex A. Adjei, 2008-02-01 We are in an exciting era in the war against cancer with real prospects for novel anticancer drugs that are cancer cell specific without the toxicities that have been the hallmark of conventional cytotoxic cancer chemotherapy Advances in cancer cell biology fueled by the molecular biology revolution have resulted in the uncovering of many novel potential molecular targets for cancer therapy New anticancer drug discovery and development is now largely focused on exploiting these new molecular targets which encompass oncogenes tumor suppressor genes and their gene products as well as targets involved in tumor angiogenesis metastasis survival and longevity mechanisms Exploitation of some of these targets has already yielded fruits and introduced new paradigms of molecularly targeted cancer therapy into the clinic namely protein kinase inhibition by antibodies or small molecules exemplified by Herceptin trastuzumab a humanized antibody targeted against the HER 2 growth factor receptor tyrosine kinase for the treatment of metastatic breast cancer and Gleevec a small molecule bcr abl kinase inhibitor for the treatment of chronic myelogenous leukemia

Molecular Diagnosis of Genetic Diseases Rob Elles, 2008-02-01 This completely revised and updated second edition to integrates the many new technologies and insights now available for the diagnosis of genetic diseases The authors use such methodologies as PCR optimization dosage analysis mutation scanning and quantitative fluorescent PCR for aneuploidy analysis Neurofibromatosis type 1 and Duchenne muscular dystrophy These largely generic methodologies may be adapted to most genetic conditions for which a molecular diagnosis is relevant no matter how frequent or rare their incidence Molecular

Diagnosis of Genetic Diseases Second Edition offers diagnostic molecular geneticists a unique opportunity to sharpen their scientific skills in the design of assays their execution and their interpretation **Genetics Manual** G. P. Redei, 1998 Redei has created an outstanding compendium of genetics Arranged as a dictionary the book is almost an encyclopedic collection of terms concepts The author has managed to define terms with appropriate mixtures of depth detail for the researcher along with clarity useful for the nonexpert Choice 1998 *Blood/Brain Barrier* Sukriti Nag, 2008-02-01 Blood brain barrier BBB breakdown leading to cerebral edema occurs in many brain diseases such as trauma stroke inflammation infection and tumors and is an important factor in the mortality arising from these conditions Despite the importance of the BBB in the pathogenesis of these diseases the molecular mechanisms occurring at the BBB are not completely understood In the last decade a number of molecules have been identified not only in endothelial cells but also in astrocytes pericytes and the perivascular cells that interact with endothelium to maintain cerebral homeostasis However the precise cellular interactions at a molecular level in steady states and diseases have still to be determined The introduction of new research techniques during the last decade or so provide an opportunity to study the molecular mechanisms occurring at the BBB in diseases The Blood Brain Barrier Biology and Research Protocols provides the reader with details of selected morphologic permeability transport in vitro and molecular techniques for BBB studies all written by experts in the field Each part is preceded by a review that emphasizes the advantages and pitfalls of particular techniques as well as offering much relevant current information The techniques provided will be helpful to both beginners in BBB research and those more experienced investigators who wish to add a specific technique to those already available in their laboratories **Viral Vectors for Gene Therapy** Curtis A. Andrew P. Robinson, Martin P. Cranage, Michael J. Hudson, 2008-02-01 Vaccine research and development is advancing at an unprecedented pace with an increasing emphasis on rational design based upon a fundamental understanding of the underlying molecular mechanisms. The aim of this volume is to provide a selection of contemporary protocols that will be useful to both novice and advanced practitioner alike. The variety of procedures required to design, develop, produce and assess a vaccine is immense and covers aspects of chemistry, biochemistry, molecular biology, cell biology and immunology. No single volume can hope to cover these topics exclusively. Rather here we attempt to provide a methods sourcebook focusing on hands-on practical advice. Complementary and background information may be found in other volumes in the Methods in Molecular Medicine series. Of particular interest are volumes on Dendritic Cell Protocols, Interleukin Protocols, Vaccine Adjuvants and DNA Vaccines. Since the publication of the first edition of Vaccine Protocols, there have been major advances particularly in the areas of bacterial genomics, antigen-specific T cell quantification, genetic manipulation of vaccine vectors, the harnessing of natural molecules concerned with the regulation of immune responses and the burgeoning field of DNA vaccinology. Hence the extensive revision of this edition with new chapters on live viral vaccine vectors, attenuated bacterial vectors, immunomodulators, MHC peptide tetrameric complexes and the identification of vaccine candidates by genomic analysis. Additionally, chapters from the first edition have been updated to accommodate state-of-the-art methods in vaccinology.

Molecular Diagnosis of Infectious Diseases Jochen Decker, Udo Reischl, 2008-02-01 Populations of the western world are now healthier and enjoying higher life expectancy than ever. They are beginning to benefit from an array of costly new therapies made possible through recent rapid advances in medical science and technology and their demands on modern medicine are rising. Meanwhile healthcare systems are struggling with their outdated legacy models of the mid 20th century and are experiencing ever increasing financial pressure from governments and health insurance organizations. The equation is no longer in balance and this predicament is forcing societies to explore new approaches to managing healthcare in the future. Since the first edition of Molecular Diagnosis of Infectious Diseases was published, we have witnessed the sequencing of the almost complete human genome and a shift in medical research from an emphasis on genetics to the advancement and useful application of proteomics. Bioinformatics has become the key tool for managing and analyzing the upsurge of data and faster and more effective test methods and technologies have opened up new prospects for industry and academia. The tools of modern genomics and proteomics are now being utilized to specifically guide the discovery of drugs for the prevention, diagnosis and treatment of human disease. They may also help us to find a way out of the current healthcare calamity.

Hepatitis B and D Protocols Robert K. Hamatake,Johnson Y. N. Lau,2008-02-01 Despite the availability of an effective vaccine there are still 400 million people worldwide who are chronically infected with hepatitis B virus HBV For them the vaccine as currently applied has no value Given the possible consequences of HBV infection the number of those chronically infected with HBV presents an enormous public health challenge For example the major etiology of hepatocellular carcinoma HCC is chronic infection with HBV Although fifth in cancer incidence worldwide HCC liver cancer is the third leading cause

of cancer death The high mortality associated with HCC arises because the disease is often detected late and is unresponsive to treatment The number of deaths caused by PHCC is expected to rise over the next 20 years Those chronically infected with HBV have a life risk of death to HCC of between 10 and 25% Even the limited efficacy of drugs for the treatment of chronic HBV helps underscore the point that this disease is responsive to therapy Drugs that target the polymerase e.g. hepsera and lamivudine and interferon alpha represent two distinct strategies and show that both conventional antiviral and immunotherapeutic approaches can be used in management However the current inventory of therapeutics is inadequate Interferon alpha is of limited value only parenterally available and fraught with adverse reactions

Tumor Necrosis Factor Angelo Corti, Pietro Ghezzi, 2008-02-02 Because tumor necrosis factor (TNF) plays a pivotal role in the regulation of homeostasis and inflammatory immune responses it offers valuable research opportunities to develop new drugs for the treatment of a wide range of disorders including cancer septic shock rheumatoid arthritis and other inflammatory diseases In *Tumor Necrosis Factor Methods and Protocols* well versed experimentalists survey the basic and translational research being conducted in this field and describe in detail the methods they have developed for TNF production characterization mutagenesis and detection in biological specimens They also provide several in vitro assays and animal models for studying the role of TNF in various TNF related diseases and in cancer The protocols presented follow the successful *Methods in Molecular Medicine*™ series format each one offering step by step laboratory instructions an introduction outlining the principle behind the technique lists of equipment and reagents and tips on troubleshooting and avoiding known pitfalls Comprehensive and highly practical *Tumor Necrosis Factor Methods and Protocols* offers molecular and cellular biologists pharmacologists and toxicologists a diverse set of productive cutting edge tools for illuminating the pathophysiological roles of TNF in disease and for identifying new drugs

Pediatric Hematology Nicholas J. Goulden, Colin G. Steward, 2008-02-01 Much of the progress in the diagnosis classification and treatment of childhood hematological disorders has come from a partnership between clinicians and scientists Indeed access to molecular techniques is now an integral part

of the practice of modern pediatric hematology The aim of Pediatric Hematology Methods and Protocols is to provide a collection of scientific protocols that cover the major aspects of the discipline Most clinicians will be familiar with the difficulties inherent in establishing the underlying diagnosis in genetic marrow failure syndromes A particular concern is failure to diagnose those associated with DNA repair defects In Chapter 1 Dokal and colleagues present simple protocols for the molecular investigation of Fanconi anemia and dyskeratosis congenita Molecular diagnosis is also important in children with congenital pure red cell aplasia owing to the highly variable phenotype of this condition In Chapter 2 Ball describes relevant protocols for the investigation of Diamond Blackfan anemia Hereditary hemoglobinopathy is a major cause of death and morbidity throughout the world This area has seen great advances in screening and antenatal diagnosis In Chapter 3 Old details protocols for the molecular diagnosis of most forms of hemoglobinopathy High quality accurate molecular testing on small amounts of material has been fundamental to progress in antenatal diagnostics The introduction to his comprehensive chapter includes a discussion of the general principles that underpin these studies In contrast to hemoglobinopathy severe hemophilia is uncommon

Molecular Diagnosis of Cancer Joseph E. Roulston, John M. S. Bartlett, 2008-02-01 We are currently experiencing a fundamental shift in the way in which we approach the characterization of cancer Never before has the make up of cancer tissues and individual cells been so exhaustively researched and characterized We are now capable of producing molecular fingerprints that characterize the expression of all known and unknown genes within tumors and their surrounding tissues More than 30 000 different genes may be measured in each patient's tumor in a single experiment Simultaneously novel therapies that exploit the molecular roadmap have been developed and are now being offered to patients These novel agents such as Glivec Herceptin Iressa and others specifically target individual genes within tumors and can produce dramatic responses in some patients These drugs are only the forerunners of a coming tidal wave of novel therapeutics that individually target specific molecules within cancer cells more than 300 such agents are currently in phase I or II clinical trials This is an exciting time for cancer specialists and patients alike However if we have learned anything from the past 50 or more years of research into cancer it is that Lord Beaverbrook in founding the British national health service in the 1950s was frighteningly prescient when he defined the primary goal of health care to be Diagnosis Diagnosis Diagnosis Now more than ever it is essential that appropriate diagnostic methods and approaches are applied to the selection of patients for treatment

Pain Research Z. David Luo, 2008-02-02 The detrimental impacts of pain on the quality of our daily life have drawn increasing attention from researchers health care providers policymakers and social workers The reality of effective painkillers specifically designed for different types of pain states has been obscured by missing knowledge of the mechanisms of different types of pain Thus studying the complexity of pain transduction which includes various insults to the peripheral nervous systems sensitized spinal circuits and altered signals ascending to or descending from the brain has emerged as a high priority task on the agenda of pharmaceutical companies and other private as well as public agencies

To accomplish this mission one requires a combination of well integrated systems such as animal models resembling the pathological conditions of pain transduction and an understanding of the interactions among pain transducers and mediators at the molecular level. Thanks to rapid advancements in the development of novel cellular and molecular biology techniques as well as in our understanding of physiology and of the behavioral pharmacology of pain transduction the time is now ripe for dissecting the molecular mechanisms of pain transduction using multidisciplinary approaches. Indeed my acceptance of the invitation from the series editor Dr John Walker to assemble a book of methods and protocols for pain research was inspired by these emerging needs. The purpose of Pain Research Methods and Protocols is to provide step by step methods and protocols of multidisciplinary approaches related to the study of pain transduction.
