

# Cell Cycle Regulation

How does a cell know it is time to divide?

## Why?

Quality control inspectors typically do not limit their product testing to the final product at the end of the assembly line. They monitor all aspects of production in hopes of preventing larger problems down the line. Likewise, when cells are progressing through the cell cycle there are processes in place that check on the cell's progress. Is everything happening according to plan? Are there sufficient resources to complete the task of cell division? Tightly regulating the cell cycle keeps a multicellular organism healthy by conserving materials. This ensures that new cells receive accurate genetic information, and also prevents uncontrolled growth that may lead to diseases like cancer.

## Model 1 – The Cell Cycle

1. Review the phases of the cell cycle in Model 1 by placing the abbreviated phase name ( $G_1$ ,  $S$ ,  $G_2$ , or  $M$ ) next to the proper description.

<u><math>G_1</math></u>	The cell grows by producing more proteins and organelles.
<u><math>S</math></u>	DNA replication occurs.
<u><math>G_2</math></u>	The cell prepares for cell division with the appearance of centrosomes.
<u><math>M</math></u>	Mitosis and cytokinesis occurs.

2. Some cells, like mature nerve cells or muscle cells, do not divide. Other cells will divide only when the cellular environment signals that it is necessary. According to Model 1, what "phase" of the cell cycle are these cells said to be in when they are not dividing or planning to divide?

According to Model 1, the  $G_0$  phase of the cell cycle is where those cells are located in when they are not dividing or planning to divide.

The mind unlearns with difficulty what has long been impressed upon it Seneca Reductionism is without question the most successful analytical approach available to the experimental scientist With the advent of techniques for cloning and sequencing DNA and the development of a variety of molecular probes for localizing macromolecules in cells and tissues the biologist now has available the most powerful reductionist tools ever invented The application of these new technologies has led to a veritable explosion of facts regarding the types and organization of nucleotide sequences present in the genomes of eukaryotes These data offer a level of precision and predictability which is unparalleled in biology Recombinant DNA techniques were initially developed to gather information about the structure and organization of the DNA sequences within a genome The power and potential of these techniques however extend far beyond simple data collection of this kind In an attempt to use the new technology as a basis for analyzing development and evolution attention was first focused on the topic of gene regulation an approach that had proven so successful in prokaryotes It is now clear that this has not been an adequate approach Lewin 1984 has quoted Brenner as stating at the beginning it was said that the answer to the understanding of development was going to come from a knowledge of the molecular mechanisms of gene control I doubt whether anyone believes this any more
