absorption coefficient to be $\mu = -1.219$ with $\sigma_\mu = 0.115$ and we used this data to estimate a value of $E = .70$ MeV with $\sigma_E = .50$ MeV. This was also in close agreement with the accepted value of 0.662 MeV.

Procedure:

To begin this experiment, we first had to calibrate the Geiger counter. We did this by adjusting the High voltage supply and taking measurements in 20V steps until the count rate raised by less than 10% for a 100 V increase. This insured that the Geiger counter was in its plateau region, and minimized the effect of HV variation on the measurements. After properly setting the HV level, we measured the amount of background radiation detected by the Geiger counter. We did this by removing all radioactive samples and shielding them with lead and measuring the count detected by the Geiger counter in 15 seconds. The equipment was set up in the following fashion:

After this, we began to measure the range of the β particles. To do this, we placed a Thallium-204 sample under the Geiger tube to emit β particles as shown below:

We conducted trials by taking measurements of the count emitted per 30 seconds, adding an additional sheet of aluminum foil absorber each trial. We did this until the rate of count was comparable to the background level we determined earlier. For the last few trials, we increased the time period to 45 seconds to lessen the effect of error.

After this, we replaced the Thallium source with a Cesium-137 sample and repeated the process to measure the absorption of γ rays. For this, we used lead absorbers instead of aluminum ones.

New Comment

Nelson Sia

Or was this 30 seconds? Could someone please check the instructions and make sure this was right?

Andra Roysden

Just checked it was 15 seconds.

Nelson Sia

4/9/2014 - 4:37 PM

Reminder for me to work on the section on experimental error later on in the report.
