

instantaneous peaks test mechanical reliability (cone and diaphragm excursion). Note that the sine wave test signals sometimes used have a much less demanding peak value relative to their average level. In actual use, long-term levels exist from several seconds on up, but we apply the long-term average for several hours, adding another extra measure of reliability.

Specifically, the EVM-15L, Pro-Line is designed to withstand the power test described in the revised EIA Standard RS-426A. The EIA test spectrum is applied for eight hours. To obtain the spectrum, the output of a white noise generator (white noise is a particular type of random noise with equal energy per bandwidth in Hz) is fed to a shaping filter with 6-dB-per-octave slopes below 40 Hz and above 318 Hz. When measured with the usual constant-percentage bandwidth analyzer (one-third-octave), this shaping filter produces a spectrum whose 3-dB-down points are at 100 Hz and 1200 Hz with a 3-dB-per-octave slope above 1200 Hz. This shaped signal is sent to the power amplifier with the continuous power set at 400 watts into the 6 ohm EIA equivalent impedance, (49 volts true RMS). Amplifier clipping sets instantaneous peaks at 6 dB above the continuous power, or 1600 watts peak (98.0 volts peak). This procedure provides a rigorous test of both thermal and mechanical failure modes.

## RECOMMENDED ENCLOSURES

### Replacement Use in Existing Enclosures

The EVM-15L, Pro-Line will often be used to replace interior speakers in existing enclosures. Mechanical and electrical characteristics are such that the superior efficiency, sound quality, and reliability of the EVM-15L, Pro-Line will be realized in virtually any sealed, vented (bass reflex) or horn-loaded enclosures.

### Vented Enclosures

The most extended, lowest distortion, and best controlled bass performance is usually realized in properly designed vented enclosures. In such designs, the vent, or port, actually reproduces the lowest octave or so of bass response. The vent is driven to full acoustic output by a relatively small motion of the speaker cone itself, acting through the air contained within the enclosure. The excursion of the EVM-15L, Pro-Line at these frequencies is much reduced compared to sealed or open-backed enclosures, directly reducing harmonic distortion and the possibility of speaker "bottoming."

The 3.2-cubic-foot TL606 enclosure has a low-frequency 3-dB-down point ( $f_3$ ) of 63 Hz, ideal for bass and mid-range applications, and many vocal reinforcement situations. Relative to a sealed system of similar output ability, the box tuning of 55 Hz reduces cone excursion, over a usefully wide frequency range of 55 Hz to over 150 Hz.

For bass use the TL606 vent should be partially covered to lower box tuning to 40 Hz ("step-down" mode). This discourages speaker bottoming at the low bass notes and provides a low-frequency response that rolls off slowly below 150 Hz ( $f_3 = 78$  Hz), performance typical of the most popular bass systems. With appropriate electronic boost, an  $f_3$  of 42 Hz may also be obtained, a beneficial extension for many vocal reinforcement applications.

Figure 8 shows small-signal total acoustic power output versus frequency for the TL606/EVM-15L, Pro-Line. In addition, Figure 7 shows the maximum acoustic power output versus frequency. The maximum output is limited by either (1) the thermal power handling capacity of the speaker, or (2) the speaker's maximum linear cone excursion capabilities, whichever occurs first. Note that some 2 to 3 dB of maximum output in the 60 to 90 Hz range is sacrificed when the step-down mode is used.

Details on TL606 design, construction, and equalization may be obtained from Electro-Voice by requesting "TL606 Builders Plans," Form 1545-523. Multiple TL606's may also be constructed. For example, a dual TL606 would have twice the internal volume of a single TL606, with the vent area doubled and vent length unchanged. The vent area may be either all-in-one or split into two or more separate vents, as long as the total vent area remains the same.

## SPECIAL NOTE ON LOW-FREQUENCY PERFORMANCE

The TL606 vented enclosure and associated performance specifications shown earlier were determined in accordance with the definitive analysis of A.N. Thiele, R.H. Small, and others (for example, see A.N. Thiele, "Loudspeakers in Vented Boxes," J. Audio Eng. Soc., Part I, Vol. 19, May 1971, pp. 382-391; Part II, Vol. 19, June 1971, pp. 471-483). Other vented box sizes and tunings are quite feasible and may give performance more suitable for a particular application.

By applying the work of Thiele and Small, Electro-Voice engineers developed a computer program which easily, quickly, and
