Speight, 2020-04-14

Gasification is one of the most important advancements that has ever occurred in energy production. Using this technology, for example, coal can be gasified into a product that has roughly half the carbon footprint of coal. On a large scale, gasification could be considered a revolutionary development, not only prolonging the life of carbon-based fuels but making them greener and cleaner. As long as much of the world still depends on fossil fuels, gasification will be an environmentally friendlier choice for energy production. But gasification is not just used for fossil fuels. Waste products that would normally be dumped into landfills or otherwise disposed of can be converted into energy through the process of gasification. The same is true of biofeedstocks and other types of feedstocks, thus making another argument for the widespread use of gasification. The Handbook of Gasification Technology covers all aspects of the gasification in a one-stop shop from the basic science of gasification and why it is needed to the energy sources, processes, chemicals, materials, and machinery used in the technology. Whether a veteran engineer or scientist using it as a reference or a professor using it as a textbook, this outstanding new volume is a must-have for any library.

On January 1988, the ascertained and economically accessible reserves of Natural Gas (NG) amounted to over 144 000 billion cubic meters worldwide, corresponding to 124 billion

tons of oil equivalents comparable with the liquid oil reserves which are estimated to be 138 billion TOE It is hypothesized that the volume of NG reserve will continue to grow at the same rate of the last decade Forecasts on production indicate a potential increase from about 2 000 billion cubic meters in 1990 to not more than 3 300 billion cubic meters in 2010 even in a high economic development scenario NG consumption represents only one half of oil 1 9 billion TOE y as compared to 3 5 of oil Consequently in the future gas will exceed oil as a carbon atom source In the future the potential for getting energetic vectors or petrochemicals from NG will continue to grow The topics covered in Natural Gas Conversion V reflect the large global R D effort to look for new and economic ways of NG exploitation These range from the direct conversion of methane and light paraffins to the indirect conversion through synthesis gas to fuels and chemicals Particularly underlined and visible are the technologies already commercially viable These proceedings prove that mature and technologically feasible processes for natural gas conversion are already available and that new and improved catalytic approaches are currently developing the validity and feasibility of which will soon be documented This is an exciting area of modern catalysis which will certainly open novel and rewarding perspectives for the chemical energy and petrochemical industries *Sustainable Power*
