Handbook of Water and Wastewater Systems Protection Robert M. Clark, Simon Hakim, Avi Ostfeld, 2011-09-01 Following the events of 9 11 the Administrator of the US Environmental Protection Agency created the Water Protection Task Force WPTF which identified water and wastewater systems as a major area of vulnerability to deliberate attack The WPTF suggested that there are steps that can be taken to reduce these vulnerabilities and to make it as difficult as possible for potential saboteurs to succeed The WPTF recommended that be scrutinized with renewed vigor to secure water and wastewater systems against these possible threats It also recommended that water and wastewater systems have a response plan in place in the event an act of terrorism occurs The WPTF identified water distribution networks as an area of special vulnerability and highlighted the need for rapid on line detection methods that are accurate and have a wide detection range As a result of these recommendations novel technologies from various fields of science and engineering are now addressing water security issues and water and wastewater utilities are looking for innovative solutions Once such technologies are available there will be a rapid implementation process that will present many business opportunities for the private sector However in addition to terrorist threats water and wastewater systems are inherently vulnerable to natural disasters such as earthquakes and floods This volume will address the problems associated with both intended terrorist attacks and natural disasters affecting water or wastewater systems The book is divided into parts based on the kinds of threats facing water and wastewater systems 1 a direct attack on water and wastewater infrastructure storage reservoirs and distribution and collection networks 2 a cyber attack disabling the functionality of the water and wastewater systems or taking over control of key components which might result in system failures and 3 a deliberate chemical or biological contaminant injection at one of the water distribution system s nodes It will examine unique plans technological and managerial innovations for protecting such systems and includes descriptions of projects that were implemented to respond to natural disasters Case studies are presented that discuss existing projects and evaluate their performance with an emphasis on providing guidelines and techniques that can be implemented by water and wastewater planners and managers to deal with natural and manmade disasters should they occur

Topics on System Analysis and Integrated Water Resources Management Andrea Castelletti, Rodolfo Soncini-Sessa, 2006-10-19 The Integrated Water Resources Management IWRM paradigm has been worldwide recognized as the only feasible way currently available to ensure a sustainable perspective in planning and managing water resource systems It is the inspiring principle of the Water Framework Directive adopted by the European Union in 2000 as well as the main reference for all the water related activity of UNESCO in the third world countries However very often real world attempts of implementing IWRM fail for the lack of a systematic approach and the inadequacy of tools and techniques adopted to address the intrinsically complex nature of water

systems This book explores recent and important contributions of System Analysis and Control Theory to the technical application of such paradigm and to the improvement of its theoretical basis Its prior aim is to demonstrate how the modelling and computational difficulties posed by this paradigm might be significantly reduced by strengthening the efficiency of the solution techniques instead of weakening the integration requirements The first introductory chapter provides the reader with a logical map of the book by formalizing the IWRM paradigm in a nine step decisional procedure and by identifying the points where the contribution of System Analysis and Control Theory is more useful The book is then organized in three sections whose chapters analyze some theoretical and mathematical aspects of these contributions or presents design applications The outstanding research issues on the border between System Analysis and IWRM is depicted in the last chapter where a pull of scientists and experts coordinated by Prof Tony Jakeman describe the foreseeable scenario The book is based on the most outstanding contributions to the IFAC workshop on Modelling and Control for Participatory Planning and Managing Water Systems held in Venice September 28 October 1 2004 That workshop has been conceived and organized with the explicit purpose of producing this book the maximum length of the papers was unusually long of the size of a book chapter and only five long oral presentations were planned each day thus allowing for a very useful and constructive discussion Contributions from the leading world specialists of the field Integration of technical modelling aspects and participatory decision making Good compromise between theory and application

Hybrid Solutions for the Modelling of Complex Environmental Systems Christian E. Vincenot, Stefano Mazzoleni, Lael Parrott, 2017-01-11 Systems studied in environmental science due to their structure and the heterogeneity of the entities composing them often exhibit complex dynamics that can only be captured by hybrid modeling approaches While several concurrent definitions of hybrid modeling can be found in the literature it is defined here broadly as the approach consisting in coupling existing modelling paradigms to achieve a more accurate or efficient representation of systems The need for hybrid models generally arises from the necessity to overcome the limitation of a single modeling technique in terms of structural flexibility capabilities or computational efficiency This book brings together experts in the field of hybrid modelling to demonstrate how this approach can address the challenge of representing the complexity of natural systems Chapters cover applied examples as well as modeling methodology
