### **Systems**

There are two major systems in operational use Cyscan made by Alstom, and Fan beam made by MDL, they both give a relative range and bearing, to a reflector, or reflectors. The systems have multiple uses, it can be used to provide fixing information for a DP vessel, it can be used to track targets relative to a vessel e.g. a seismic boat can track the relative position of tail buoys, or a pipe-laying barge can track the position of anchor handling vessels relative to the barge. Systems may track single or multiple targets.

### **Components**

The operating station

The laser device that transmits and receives the laser pulse.

The reflector (either tube, prismatic type, or combined type).

### **Mode of operation**

1. The reflector is deployed
2. The operating station is switched to search
3. The unit will complete a 360 degree sweep and report all objects that reflect.
4. The laser device send pulses of light out these strike the reflector and are returned.
5. As the pulse arrives at the laser device, the round trip of the pulse is noted, and with the known speed of light the range is calculated.
6. As the return pulse arrives, there is a device that measures the direction the laser device is pointing (the electro optical encoder) this is noted and using a gyro input bearing is derived.
7. The operator then selects the reflector from the reported objects
