Overexploitation and Contamination of Shared Groundwater Resources Christophe J.G. Darnault, 2008-02-02 Forty percent of the world's population depends upon increasingly scarce and shared water resources This situation is critical at both international and national levels not only for socio economic development but also for the regional stability The intensive use of groundwater for irrigation and water supply is adding pressures to scarce water resources and the environment through overexploitation and contamination which result in situations that may lead to conflicts The book from the NATO ASI on Overexploitation and Contamination of Shared Groundwater Resources Management Bio technological and Political Approaches to Avoid Conflicts is written by authors from different disciplines and regions of the world The aim of the book is to contribute to the knowledge of shared groundwater resources management to avoid conflicts by considering multi disciplinary approaches based on effective and equitable water sharing for all water users through cooperation and within a compassionate ecological framework along with the need for sustainable resources development and the quest for environmental and human security The scope of the book covers the hydrogeological environmental bio technological and management aspects of shared groundwater resources integrating social economic and political dimensions as well as legal and educational perspectives

processes involved in injecting and storing CO₂ in such formations still need to be better quantified and methods for characterizing modeling and monitoring this type of CO₂ storage in such formations must be rapidly developed and refined

Zhan, Quanrong Wang, Zhang Wen, 2019-10-01 In recent decades the study of groundwater flow and solute transport has advanced into new territories that are beyond conventional theories such as Darcy's law and Fick's law The studied media have changed from permeable porous and fractured ones to much less permeable ones such as clay and shale The studied pore sizes have also changed from millimetres to micro meters or even nano meters The objective of this Special Issue is to report recent advances in groundwater flow and solute transport that push the knowledge boundary into new territories which include but are not limited to flow and transport in sloping aquifer hillslopes coupled unsaturated and saturated flow

coupled aquifer vertical horizontal slant well flow interaction of aquifer with connected and disconnected rivers non Darcian flow anomalous transport beyond the Fickian scheme and flow and transport in extremely small pore spaces such as shale and tight sandstones Contributions focusing on innovative experimental numerical and analytical methods for understanding unconventional problems such as the above listed ones are encouraged and contributions addressing flow and transport at interfaces of different media and crossing multiple temporal and spatial scales are of great value
