

Feedback Mechanisms

How do organisms regulate complex systems through chemical interactions?

Why?

The heating system of a house works to keep the temperature constant. If the house gets too cold, then the heat automatically turns on to warm the house. The heat stops when the preset temperature is reached. This is an example of a **feedback mechanism**. Organisms use many feedback mechanisms to either maintain or amplify important chemical systems. This could happen at a molecular level to coordinate the function of a single enzyme or it could happen throughout the body to regulate the organism's internal temperature.

Model 1 – Positive and Negative Feedback

1. What two types of feedback mechanisms are illustrated in Model 1?

Positive and Negative

2. Define the words below as they are used in everyday language.

Stimulus - **Something that causes a reaction to occur**

Signal - **message sent i.e. phone call**

Response - **reaction to a stimulus i.e. move away from a hot object**

3. Identify at least three similarities in the two types of feedback mechanisms in Model 1.

Three similarities: Stimulus, signal, response

Positive Feedback in Natural Systems Donald L. DeAngelis, Wilfried M. Post, Curtis C. Travis, 2012-12-06 Cybernetics a science concerned with understanding how systems are regulated has reflected the preoccupations of the century in which it was born Regulation is important in twentieth century society where both machines and social organizations are complex Cybernetics focused on and became primarily associated with the homeostasis or stability of system behavior and with the negative feedbacks that stabilize systems It paid less attention to the processes opposite to negative feedback the positive feedback processes that act to change systems We attempt to redress the balance here by illustrating the enormous importance of positive feedbacks in natural systems In an article in the American Scientist in 1963 Maruyama called for increased attention to this topic noting that processes of change could occur when a deviation in anyone component of the system caused deviations in other components that acted back on the first component to reinforce or amplify the initial deviation The deviation amplification is the result of positive feedback among system components Maruyama demonstrated by numerous examples that the neglect of such processes was unjustified and suggested that a new branch of cybernetics the second cybernetics be devoted to their study [Benefiting from the Feedback Mechanism](#) Talaat Haji Husain (Dato'), 2005
