

**Upgrading Existing Grounding System for Substation Expansion Projects
- A Case Study**

SUMMARY

This paper describes a design method for upgrading the existing grounding system of a high voltage substation within a substation expansion project. The grounding system design meets the IEEE Std 80 and the CSA standards for safety. A soil resistivity test, according to the Wenner four-pin method based on IEEE Std 81 standard, is performed prior to the start of the study. Data from the soil resistivity test and as-built drawings of the existing grounding system of the substation are used to create the ground system model. Predetermined split factor curves from the IEEE Std 80 standard are not used. A detailed equivalent circuit model is prepared for fault current division for single-line-to-ground (SLG) faults at different voltage levels. The split factor of each fault is then calculated accordingly. For each voltage level, the location of SLG fault is analyzed. Outside the substation, transmission line or feeder faults are considered while bus faults are studied inside the substation. By performing these steps, it is possible to examine the current status of the substation.

To consider substation expansions, the ground grid is examined using software and, if required, extended to meet the ground potential rise (GPR), touch and step potential criteria imposed by the standards. The ultimate stage of the substation is considered to analyze the worst case scenario. After the grounding system is upgraded in the software through the addition of new ground conductors and ground rods, the GPR, step and touch potentials of the substation should be within their permissible limits. As long as the design options are safe according to the standards, the most economical solution is proposed as the final design.

As a case study for this procedure, an existing high voltage substation with 230/60/12 kV voltage levels which requires upgrading is considered. The substation feeds numerous medium voltage feeders, is interconnected via 230 kV and 60 kV transmission lines, and has a number of 230/60 kV and 230/12 kV power transformers. WinIGS software is used to calculate GPR, step and touch potentials. A discussion and conclusions on the design method and simulation results are included.
