Resource Proportional Software Design for Emerging Systems Suparna Bhattacharya, Kanchi Gopinath, Doug Voigt, 2020-02-21 Efficiency is a crucial concern across computing systems from the edge to the cloud Paradoxically even as the latencies of bottleneck components such as storage and networks have dropped by up to four orders of magnitude software path lengths have progressively increased due to overhead from the very frameworks that have revolutionized the pace of information technology Such overhead can be severe enough to overshadow the benefits from switching to new technologies like persistent memory and low latency interconnects Resource Proportional Software Design for Emerging Systems introduces resource proportional design RPD as

a principled approach to software component and system development that counters the overhead of deeply layered code without removing flexibility or ease of development RPD makes resource consumption proportional to situational utility by adapting to diverse emerging needs and technology systems evolution Highlights Analysis of run time bloat in deep software stacks an under explored source of power performance wastage in IT systems Qualitative and quantitative treatment of key dimensions of resource proportionality Code features Unify and broaden supported but optional features without losing efficiency Technology and systems evolution Design software to adapt with changing trade offs as technology evolves Data processing Design systems to predict which subsets of data processed by an analytics or ML application are likely to be useful System wide trade offs Address interacting local and global considerations throughout software stacks and hardware including cross layer co design involving code data and systems dimensions and non functional requirements such as security and fault tolerance Written from a systems perspective to explore RPD principles best practices models and tools in the context of emerging technologies and applications This book is primarily geared towards practitioners with some advanced topics for researchers The principles shared in the book are expected to be useful for programmers engineers and researchers interested in ensuring software and systems are optimized for existing and next generation technologies The authors are from both industry Bhattacharya and Voigt and academic Gopinath backgrounds Grid Computing Fran Berman, Geoffrey Fox, Anthony J. G. Hey, 2003-04-18 Grid computing is applying the resources of many computers in a network to a single problem at the same time Grid computing appears to be a promising trend for three reasons 1 Its ability to make more cost effective use of a given amount of computer resources 2 As a way to solve problems that can't be approached without an enormous amount of computing power 3 Because it suggests that the resources of many computers can be cooperatively and perhaps synergistically harnessed and managed as a collaboration toward a common objective A number of corporations professional groups university consortiums and other groups have developed or are developing frameworks and software for managing grid computing projects The European Community EU is sponsoring a project for a grid for high energy physics earth observation and biology applications In the United States the National Technology Grid is prototyping a computational grid for infrastructure and an access grid for people Sun Microsystems offers Grid Engine software Described as a distributed resource management tool Grid Engine allows engineers at companies like Sony and Synopsys to pool the computer cycles on up to 80 workstations at a time the Grid is a very hot topic generating broad interest from research and industry e.g. IBM Platform Avaki Entropia Sun HP Grid architecture enables very popular e-Science projects like the Genome project which demand global interaction and networking In recent surveys over 50% of Chief Information Officers are expected to use Grid technology this year Grid Computing Features contributions from the major players in the field Covers all aspects of grid technology from motivation to applications Provides an extensive state of the art guide in grid computing This is essential reading for researchers in Computing and Engineering physicists statisticians

Network and Parallel Computing Hai Jin,Guangrong Gao,Zhiwei Xu,Hao Chen,2004-10-14 This proceedings contains the papers presented at the 2004 IFIP International Conference on Network and Parallel Computing NPC 2004 held at Wuhan China from October 18 to 20 2004 The goal of the conference was to establish an international forum for engineers and scientists to present their ideas and experiences in network and parallel computing A total of 338 submissions were received in response to the call for papers These papers were from Australia Brazil Canada China Finland France Germany Hong Kong India Iran Italy Japan Korea Luxemburg Malaysia Norway Spain Sweden Taiwan UK and USA Each submission was sent to at least three reviewers Each paper was judged according to its originality innovation readability and relevance to the expected audience Based on the reviews received a total of 69 papers were accepted to be included in the proceedings Among the 69 papers 46 were accepted as full papers and were presented at the conference We also accepted 23 papers as short papers each of these papers was given an opportunity to have a brief presentation at the conference followed by discussions in a poster session Thus due to the limited scope and time of the conference and the high number of submissions received only 20% of the total submissions were included in the final program *Robust Communication Networks: Interconnection and Survivability* Nathaniel Dean,Derbiau Frank Hsu,Ramamoorthi Ravi,2000 This volume contains the proceedings of a DIMACS Workshop on Robust Communication Networks held as part of the Special Year on Networks Theoreticians and practitioners presented papers on the roles of architectural interconnection and survivability in the design construction operation and application of robust communication networks Due to the advent of VLSI and fiber optics technologies it has become possible and feasible to design and construct large scale high performance high speed wireline and wireless communication networks that are also robust This opens many challenging issues and problems for both the theory community and practitioners Of particular interest is how these technological advances lead the way to new and challenging mathematical frontiers and set the direction for future research on and implementation of robust communication networks The nine papers chosen for this volume represent the state of the art from a variety of perspectives *Simula Research Laboratory* Aslak Tveito,Are Magnus Bruaset,Olav Lysne,2009-10-22 When researchers gather around lunch tables at conferences or in bars there are some topics that are more or less compulsory The discussions are about the home management of the university or the lab where they are working the lack of funding for important research politicians inability to grasp the potential of a particularly promising field and the endless series of committees that seem to produce very little progress It is common to meet excellent researchers claiming that they have almost no time to do research because writing applications lecturing and tending to committee work seem to take most of their time Very few ever come into a position to do something about it With Simula we have this chance We were handed a considerable annual grant and more or less left to ourselves to do whatever we thought would produce the best possible results We wanted to create a place where researchers could have the time and conditions necessary to reflect

over difficult problems uninterrupted by mundane difficulties where doctoral students could be properly supervised and learn the craft of research in a well organized and professional manner and where entrepreneurs could find professional support in developing their research based applications and innovations
