Fear And Learning From Basic Processes To Clinical Implications:

Fear and Learning Michelle G. Craske, Dirk Hermans, Debora Vansteenwegen, 2006 The goal of this volume is to bring together the most recent empirical and theoretical developments in the basic science of fear learning and to translate these developments to the clinical understanding and treatment of fears and phobias A major impetus for the volume was the recognition that basic science in fear learning is advancing far more rapidly than the clinical application of this knowledge The book is structured to cover three main areas The first presents the history of fear learning theory and fear measurement The second area examines the acquisition and maintenance of fear including neural circuitry associative pathways and cognitive mechanisms the role of avoidance and individual differences in fear learning The third area covers the extinction renewal and reinstatement of fear including neural circuitry and context dependency The volume developed out of the Special Interest Meeting on Fear and Learning in Lignely Belgium May 2003 sponsored by the Fund for Scientific Research in Flanders Belgium and inspired by Paul Eelen This volume is intended for both basic scientists and clinical scientists at undergraduate graduate and more advanced levels as well as practicing clinicians who are interested in gaining an in depth understanding of learning theory as it applies to fear and anxiety Preface PsycINFO Database Record c 2007 APA all rights reserved

Individual differences in associative learning Robin A. Murphy, Rachel M. Msetfi, 2014-09-24 Theories of associative learning have a long history in advancing the psychological account of behavior via cognitive representation There are many components and variations of associative theory but at the core is the idea that links or connections between stimuli or responses describe important aspects of our psychological experience This Frontiers Topic

considers how variations in association formation can be used to account for differences between people elaborating the differences between males and females differences over the life span understanding of psychopathologies or even across cultural contexts A recent volume on the application of learning theory to clinical psychology is one example of this emerging application e g Hazelgrove Hogarth 2012 The task for students of learning has been the development often with mathematically defined explanations of the parameters and operators that determine the formation and strengths of associations The ultimate goal is to explain how the acquired representations influence future behavior This approach has recently been influential in the field of neuroscience where one such learning operator the error correction principle has unified the understanding of the conditions which facilitate neuron activation with the computational goals of the brain with properties of learning algorithms e g Rescorla Wagner 1972 In this Frontiers Research Topic we are interested in a similar but currently developing aspect to learning theory which is the application of the associative model to our understanding of individual differences including psychopathology In general learning theories are monolithic the same theory applies to the rat and the human and within people the same algorithm is applied to all individuals If so this might be thought to suggest that there is little that learning theory can tell us about the how males and females differ how we change over time or why someone develops schizophrenia for instance However these theories have wide scope for developing our understanding of when learning occurs and when it is interfered with along with a variety of methods of predicting these differences We received contributions from researchers studying individual differences including sex differences age related changes and those using analog or clinical samples of personality and psychopathological disorders where the outcomes of the research bear directly on theories of associative learning This Research Topic brings together researchers studying basic learning and conditioning processes but in which the basic emotional attentional pathological or more general physiological differences between groups of people are modeled using associative theory This work involves varying stimulus properties and temporal relations or modeling the differences between groups **Exposure Therapy** Peter Neudeck, Hans-Ulrich

Wittchen, 2012-05-30 Despite the fact that methods of exposure therapy have proven to be highly effective in various empirical studies they are still underused and sometimes subject to controversial discussion There have been significant developments In recent years methods of exposure therapy have been applied in various areas of therapy including body dysmorphic disorder and hypochondriasis Exposure techniques also play an important role in the so called third wave therapies Acceptance Commitment Therapy Dialectical Behavior Therapy And there is more recently a revival of exposure in panic and agoraphobia and GAD On the other hand a large number of scientific articles discuss the practical applications ethical aspects amount of exposure and the theoretical foundations habituation of exposure therapy In order to provide an overview of the current debate and to point out the latest developments in the area of exposure therapy we have decided to present the current state of discussion most contributors are scientist practitioners to an interested professional audience

Fear Extinction Mohammed R. Milad, Seth D. Norrholm, 2023-11-16 This book aims to provide the reader a neuroscientific understanding surrounding a very simple question how do we learn not to fear Exploring answers to this question is very important for two reasons First learning about the neural mechanisms of fear extinction is of relevance to everyone's life it is such a basic yet relevant question to our daily experiences Therefore understanding brain mechanisms of fear and its regulation is essential from a basic neuroscience point of view Second excessive fear and the inability to regulate its expression is one of the hallmarks of fear anxiety trauma and stressor related psychopathologies And as such learning about how fear is acquired stored expressed and regulated could help advance our understanding of the etiology of psychopathology the maintenance of symptoms pertaining to failure to regulate fear and could help us develop novel therapeutics to equip providers and patients with the tools to better quell their fears The contributions contained in this book are provided by experts in the fields of basic and clinical neuroscience experimental and clinical psychology and neuropsychiatry The contributions are organized to start the reader with basic definitions of how we define fear how we study its neural circuits at the molecular and cellular levels how to study human behavior and the brain using state of the art experimental and statistical tools to how much fear contributes to psychopathology This volume ends with current advances aimed to enhance the capacity to extinguish fear a clinical result that would aid in the treatment of multiple psychiatric disorders followed by a discussion on future directions of this highly important and relevant field

Psychological Responses to Violations of Expectations: Perspectives and Answers from Diverse Fields of Psychology Mario Gollwitzer, Anna

Thorwart, Karin Meissner, 2018-03-19 From Pavlov's dog expecting food when hearing a bell to stereotypes as expectations about other people's behaviour from Bandura's self-efficacy as expectation for success and failure of one's own behaviour to the predictive brain concept in current perception theories expectations have been a central construct in different areas of psychological research. In each of these areas specific concepts, theoretical approaches and empirical methods have been developed to explain when and why expectations persist and when they do not. Many theories assume that expectations are likely to change in the face of disconfirming evidence. However, sometimes expectations persist even though they are empirically violated, suggesting that they can be sticky under certain circumstances. But what are these circumstances? And what are the psychological mechanisms that can explain why and when expectations persist or change after being confronted with expectation-violating evidence? Each contribution of the current book offers insights into individuals' reactions to violations of expectations. They show that many pieces of the puzzle have been collected in the many sub-disciplines of psychology and that putting them together in an integrative fashion stays a fascinating enterprise.

Associative Learning and Conditioning Theory Todd R. Schachtman PhD, Steve S. Reilly PhD, 2011-06-03 Although many professionals in psychology including the sub-disciplines of human learning and memory, clinical practice related to psychopathology, neuroscience, educational psychology and many other areas no longer receive training in learning and conditioning, the influence of this field remains strong. Therefore many researchers and clinicians have little knowledge about basic learning theory and its current applications beyond their own specific research topic. The primary purpose of the present volume is to highlight ways in which basic learning principles, methodology and phenomena underpin and indeed guide contemporary translational research. With contributions from a distinguished collection of internationally renowned scholars, this 23-chapter volume contains specific research issues but is also broad in scope, covering a variety of topics in which associative learning and conditioning theory apply, such as drug abuse and addiction, anxiety, fear and pain, research, advertising, attribution processes, acquisition of likes and dislikes, social learning, psychoneuroimmunology and psychopathology, e.g. autism, depression, helplessness and schizophrenia. This breadth is captured in the titles of the three major sections of the book: Applications to Clinical Pathology, Applications to Health and Addiction, Applications to Cognition, Social Interaction and Motivation. The critically important phenomena and methodology of learning and conditioning continue to have a profound influence on theory and clinical concerns related to the mechanisms of memory, cognition, education and pathology of emotional and consummatory disorders. This volume is expected to have the unique quality of serving the interests of many researchers, educators and clinicians, including for example neuroscientists, learning and conditioning researchers, psychopharmacologists, clinical psychopathologists and practitioners in the medical field.
