

**Question:**

In the vicinity of the earth, objects experience a force of gravitational attraction toward the center of the earth.

Which of the following statements is true?

- a. The force of gravity is proportional to the square of the distance between the object and the earth's center.
- b. The force of gravity acting on the object doesn't depend on the object's mass.
- c. If there is no object to experience a force of gravity, then the earth has no gravity field.
- d. The earth and the object both create their own gravity fields.
- e. The earth's force of gravity on the object is greater than the object's force of gravity on the earth.

©2012, Richard White. LearnConceptualPhysics.com

**Answer:**

The correct answer is *d*. All objects with mass influence the space around them, and create a gravity field. Objects in the gravity field experience a force of gravitational attraction toward the center of mass of the source of gravity field.

It's important to realize although we can talk about the force of gravity acting on an object in a gravity field, the gravity field due to a mass continues to exist, even if there's no object there to experience a force. The idea of a *field* allows us to draw lines like those in the diagram above so that we can picture the effect that the field has, even when not specifically considering a moon, or an apple, or any other mass that might be in the field.

**Translation and Guide** Isaac Newton, Julia Budenz, 2016-02-05. In his monumental 1687 work *Philosophiæ Naturalis Principia Mathematica* known familiarly as the *Principia*, Isaac Newton laid out in mathematical terms the principles of time, force, and motion that have guided the development of modern physical science. Even after more than three centuries and the revolutions of Einsteinian relativity and quantum mechanics, Newtonian physics continues to account for many of the phenomena of the observed world, and Newtonian celestial dynamics is used to determine the orbits of our space vehicles. This authoritative modern translation by I. Bernard Cohen and Anne Whitman, the first in more than 285 years, is based on the 1726 edition, the final revised version approved by Newton; it includes extracts from the earlier editions, corrects errors found in earlier versions, and replaces archaic English with contemporary prose and up-to-date mathematical forms. Newton's principles describe acceleration, deceleration, and inertial movement; fluid dynamics and the motions of the earth, moon, planets, and comets. A great work in itself, the *Principia* also revolutionized the methods of scientific investigation. It set forth the fundamental three laws of motion and the law of universal gravity, the physical principles that account for the Copernican system of the world as emended by Kepler, thus effectively ending controversy concerning the Copernican planetary system. The illuminating *Guide to Newton's Principia* by I. Bernard Cohen makes this preeminent work truly accessible for today's scientists, scholars, and students. Designed with collectors in mind, this deluxe edition has faux leather binding covered with a beautiful dust jacket.
