

Cutting Conics

NAME _____

In this exploration, you will discover the different cross sections created by cutting a double-napped cone with a plane. A double-napped cone is made when two solid cones are connected at their vertices. The point where the vertices touch is called the *origin* because the point would be at the origin if the double-napped cone was in a three-dimensional Cartesian coordinate system.

You will discover ways to create each of the following shapes:

Parabola

Hyperbola

Circle

Ellipse

Double-napped cones can vary by height and slant. Experiment with changing these parameters as you work through the exploration. The plane creating the cross section can vary by slope (m) and distance from the origin (b) in relation to the double-napped cone. As you cut your cones, you need to note these characteristics of the cut. Try to answer these questions as you work:

- For slope (m): How does the cut relates to the base and side of the cone? Is it parallel? perpendicular? neither?
- For relative distance from the origin (b): Is the plane close to the origin or far? What happens when you move the cut farther from or closer to the origin?

For each conic section, sketch the plane and cross section needed to create it. Then, answer the questions about that conic. Try creating each shape in different ways by varying the parameters.

The Circle

1. What are the characteristics of the plane used to create the circle?

2. What happens when the plane is closer to the origin?

The Lady's and Gentleman's Diary ,1858 **Results and Problems in Combinatorial Geometry** Vladimir G. Boltjansky,Israel Gohberg,1985-10-10 In this short book the authors discuss three types of problems from combinatorial geometry Borsuk's partition problem covering convex bodies by smaller homothetic bodies and the illumination problem They show how closely related these problems are to each other The presentation is elementary with no more than high school mathematics and an interest in geometry required to follow the arguments Most of the discussion is restricted to two and three dimensional Euclidean space though sometimes more general results and problems are given Thus even the mathematically unsophisticated reader can grasp some of the results of a branch of twentieth century mathematics that has applications in such disciplines as mathematical programming operations research and theoretical computer science At the end of the book the authors have collected together a set of unsolved and partially solved problems that a sixth form student should be able to understand and even attempt to solve **Railway and Locomotive Engineering** ,1907 *Locomotive Engineering* ,1908 English Mechanic and Mirror of Science ,1872 English Mechanic and World of Science ,1882 East European Accessions Index ,1957 *English Mechanics and the World of Science* ,1885 British Journal of Photography William Crookes,T.A.
