De Sosa,2010-09-01 Relays and instrument transformers are the building blocks of protection systems for generators busses transformers motors and power lines Yet it appears that the subject is a mystery to most The author greatly simplified the approach in presenting the fundamental ideas of protection systems After showing the basics of a fault The author presented the inverse time characteristics of overcurrent relays their pick up currents and their operating times When possible Boolean algebra was used in simplifying relay logic Several chapters describe the basics of relays and instrument transformers Finally The design project In the last chapter encapsulates the fundamental ideas in the book Control system engineers facility power engineers distribution engineers and transmission engineers should benefit from the book Protection of a 138/34.5 KV Transformer Using SEL 387-6 Relay Aamani Lakkaraju,2016 Schweitzer Engineering laboratories SEL donated the SEL 387 SEL 311L and SEL 351S relays and the SEL AMS to Missouri University of Science and Technology This thesis documents the demonstration approach to set the SEL 387 relay to protect a grounded wye grounded wye transformer and then test these settings by injecting fault currents

into the relay using the SEL AMS This thesis explains the approach to set the differential element of the SEL 387 relay to protect a transformer against internal faults and the overcurrent element of the SEL 387 relay to protect transformer against external faults A radial power system model is assumed and modeled using ASPEN Oneliner and Power Flow software Fault currents obtained from ASPEN model are injected to the relay using the SEL AMS Separate tests are performed for the differential element and the overcurrent element The objective of testing the differential element is to show that it is tripping for internal faults and restraining for external faults The approach used by the SEL 387 differential relay to make trip decisions is theoretically calculated These theoretical results are verified with results obtained from the relay fault event reports The instantaneous and time overcurrent elements are tested by running various types of faults at four different locations The objective of testing the overcurrent elements is to show that the instantaneous overcurrent elements are tripping only for transformer primary side faults and to show that primary side time overcurrent element is coordinating with the secondary side time overcurrent element Abstract page iii
