Irwin, 2010-09-08 The 2010 International Conference on Life System Modeling and Simulation LSMS 2010 and the 2010 International Conference on Intelligent Computing for Sustainable Energy and Environment ICSEE 2010 were formed to bring together researchers and practitioners in the fields of life system modeling simulation and intelligent computing applied to worldwide sustainable energy and environmental applications A life system is a broad concept covering both micro and macro components ranging from cells tissues and organs across to organisms and ecological niches To comprehend and predict the complex behavior of even a simple life system can be tremendously difficult using conventional approaches To meet this challenge a variety of new theories and methodologies have emerged in recent years on life system modeling and simulation Along with improved understanding of the behavior of biological systems novel

intelligent computing paradigms and techniques have emerged to handle complicated real world problems and applications. In particular intelligent computing approaches have been valuable in the design and development of systems and facilities for achieving sustainable energy and a sustainable environment the two most challenging issues currently facing humanity. The two LSMS 2010 and ICSEE 2010 conferences served as an important platform for synergizing these two research streams.

*Analog Circuit Design* Rudy J. van de Plassche, Willy M.C. Sansen, Johan Huijsing, 2013-06-29 The realization of signal sampling and quantization at high sample rates with low power dissipation is an important goal in many applications including portable video devices such as camcorders personal communication devices such as wireless LAN transceivers in the read channels of magnetic storage devices using digital data detection and many others. This paper describes architecture and circuit approaches for the design of high speed low power pipeline analog to digital converters in CMOS. Here the term high speed is taken to imply sampling rates above 1 Mhz. In the first section the different conversion techniques applicable in this range of sample rates is discussed. Following that the particular problems associated with power minimization in video rate pipeline ADCs is discussed. These include optimization of capacitor sizes design of low voltage transmission gates and optimization of switched capacitor gain blocks and operational amplifiers for minimum power dissipation. As an example of the application of these techniques the design of a power optimized 10 bit pipeline A/D converter ADC that achieves 1.67 mW per MS/s of sampling rate from 1 MS/s to 20 MS/s is described. 2 Techniques for CMOS Video Rate A/D Conversion. Analog to digital conversion techniques can be categorized in many ways. One convenient means of comparing techniques is to examine the number of analog clock cycles required to produce one effective output sample of the signal being quantized.
