What you need to know about Tattoos :Medical Applications, Complications, Ethical and Legal Aspects Dr. Hakim Saboowala., 2019-12-10 Tattoos are one of the most popular and prevalent forms of body art which has been practiced for centuries in many cultures throughout the world In the late eighteenth and early nineteenth centuries tattoos were as much about self expression as they were about having a unique way to identify a person s body In fact evidence of tattoos has been found in Egyptian mummies dating 4000 years back and among the Roman gladiators who used it for the purpose of identification The descriptive decorative patterns have not only been used as a means of identification but have established itself in the field of medicine as well being employed as a therapeutic modality or diagnostic method These include Corneal tattooing Gastrointestinal tattooing during endoscopy Reconstructive and Cosmetic tattooing for camouflage Radiotherapy field marking etc An emerging application of tattooing is

medical alert tattooing often practiced by the patients themselves without medical consultation inscribing their disease condition or allergy to a particular medication which may affect diagnosis or treatment. However, tattoos indicating advance health directives do not resuscitate, do not defibrillate, or the organ donor tattoo pose ethical and legal problems as they may not reflect patient's current wishes. Furthermore, they are not recognized as meeting any of the legal requirements so they cannot be considered as valid directives or as consent but only as a way to guide treatment decisions. Thus, an attempt has been made in this Booklet to outline a brief review of the numerous applications, its advantages, potential drawbacks along with the ethical and legal issues related to it. Positive Psychology and the Body: the Somatopsychic Side to Flourishing Kate Hefferon, 2013-07-16

As positive psychology continues to make leaps and bounds in terms of scientific advancement, the focus on the importance of the body within optimal functioning is still lagging. Positive Psychology and the Body provides a critical reflection on this omission, highlighting the mounting corpus of scientific research completed on the physical mechanisms which assist either momentary experiences of pleasure or longer lasting feelings of meaning and self development. Indispensable reading for students of well being, positive psychology and sports psychology, the book spans topics such as physical activity, genetics, interpersonal touch, positive sexual behaviours, nutrition and many more. Those studying and researching coaching, health, clinical psychology and counselling psychology will also find the book valuable reading. With contributions from Angela Clow and Michael Pluess. Finally, an author has addressed the white elephant in the room, the human body. Arguably one of the most important aspects of the self, the body has long been overlooked by positive psychologists as a serious point of study. This book has it all, from sex to genetics to illness. Hefferon brings an expert review of research, clear advice and fresh thinking. Dr. Robert Biswas-Diener, Managing Director, Positive Acorn LLC. With this fine textbook, Positive Psychology expands its scope considerably to include new and important perspectives from the very foundation of any psyche, the body. Indeed, we may argue that as much as any organ, the psyche is part of the body, if certainly still very strangely so. Kate Hefferon, with her colleagues, are to be strongly applauded for making new understandings of the mind-body unity so accessible to students and everyone else interested in this fascinating topic. Hans Henrik Knoop, Aarhus University, Denmark, and President, European Network for Positive Psychology. In a field of positive psychology overcrowded with simplistic treatments of happiness and the good life, Kate Hefferon has put together a truly original book. By linking principles of positive psychology with the body, Hefferon brings to light the need for a more holistic approach to the good life, one that honors the reality that we carry out this project called life, tethered to this world through our bodies. Anybody interested in a more grounded positive psychology should read this book. Corey L. M. Keyes, Professor of Sociology, Emory University, USA. In showing the relevance of positive psychology to sexuality, nutrition, health and physical activity, Kate Hefferon pushes the boundaries of positive psychology into new territory. Packed with ideas that we can apply in our own lives, students and others interested in positive psychology will find this book an excellent introduction. Well worth

the USA the prevalence varies between 10-20%. Despite its popularity complications of tattooing can occur. Little is known about its clinical aspects, pathomechanism and treatment modalities. This thesis includes an overview of all cutaneous tattoo complications including permanent makeup. These complications can be categorized in infectious, inflammatory, neoplastic and miscellaneous reactions. Infections are mainly superficial and of bacterial origin. Inflammatory complications include allergic reactions and autoimmune skin diseases. Of all allergic reactions to tattoo pigments, red pigments are most frequently involved. Autoimmune skin diseases that may be related to tattoos include psoriasis, lichen planus, sarcoidosis, vitiligo and lupus erythematosus. They may be locally triggered by the procedure of tattooing, which is referred to as the Koebner phenomenon. Although tattoo ink is thought to contain potential carcinogenic substances, the association between tattoos and skin cancer is interpreted to be coincidental because of the low reported number of cases. Miscellaneous complications include misapplication, pigment changes, blowouts, neurosensory reactions, scars and keloids. Of all chronic tattoo reactions, allergic red tattoo reactions are the most frequent. In this thesis, the aetiology, clinical aspects and treatment of these chronic skin reactions are studied. For these studies, analyses were performed of skin biopsies, in vitro sensitisation tests, 3D scanner and the clinical presentation. In the majority of these reactions, the clinical presentation is a plaque-like elevation of the red tattooed skin. One of the studies reports that the average time of onset of symptoms is 1 year after the tattoo is placed. Histopathologically, the most frequent inflammation pattern is a predominant histiocytic reaction with interface dermatitis.
