Equity Incentives And Taxation Lecture Notes In Economics And Mathematical Systems:

Equity, Incentives, and Taxation Georg Tillmann, 2012-12-06 Redistribution is one of the most fundamental issues in welfare economics. In connection with this term the following questions directly arise: What is a good redistribution? Which governmental instruments should be used to attain it? Is there a best instrument if several of them are available? Or to express it more generally, which allocations are at all attainable if special instruments are at hand? All these questions are formulated in an extremely vague way. It will be the task of the following work to make these questions precise and to give answers as far as possible. It is a matter of course that these answers will not be exhaustive because redistribution is too wide a field. I have used the word instrument intentionally. In doing so I wanted to indicate that it is not necessary to restrict oneself to income or commodity taxes as is common place in public finance when aiming at redistribution.

Efficiency and Equity in Welfare Economics Pier Carlo Nicola, 2012-08-31 Increasing efficiency in generating national income and improving equity in its distribution among economic agents is at the forefront of priorities of most modern economies. This book presents a model which aims to maximize a symmetrical welfare function under certain constraints which consider both efficiency and equity, i.e. taxes and subsidies implemented by a public authority. The model is numerically implemented and considers a set of economic agents with starting incomes that satisfy Pareto income law under various values of the alpha parameter. Also the model implementations respect the social production function. Various experiments are presented which show how income inequality measured by means of the Lorenz curve and what I call the Lorenz Gini inequality index and measures of poverty are sensibly reduced by redistributing national income without lowering efficiency in production. A case study or application of Italian personal income in 2008 is also presented.

Interaction and Market Structure Domenico Delli Gatti, Mauro Gallegati, Alan P. Kirman, 2012-12-06 This book is a collection of essays which examine how the properties of aggregate variables are influenced by the actions and interactions of heterogeneous individuals in different economic contexts. The common denominator of the essays is a critique of the representative agent hypothesis. If this hypothesis were correct the behaviour of the aggregate variable would simply be the reproduction of individual optimising behaviour. In the methodology of the hard sciences one of the achievements of the quantum revolution has been the rebuttal of the notion that aggregate behaviour can be explained on the basis of the behaviour of a single unit: the elementary particle does not even exist as a single entity but as a network, a system of interacting units. In this book new tracks in economics which parallel the developments in physics mentioned above are explored. The essays in fact are contributions to the analysis of the economy as a complex evolving system of interacting agents.

Incentives and Equity Capital in Cooperatives Carmel Nadav, 1993

Economic Sciences in the Netherlands, 1989 **Equity, Efficiency and Evolutionary Stability in Bargaining Games with Joint Production** Manfred Königstein, 2012-12-06 Result 1.10 Simple equity standards were superior to more complex ones even though the latter might be economically more relevant. Result 1.11 Equity based on quantity input and

return output was most successful and received a hit rate of almost 1 within a range of 10% i.e. within a distance of 5% of the predicted share. Result 1.12: A substantial share of observations is consistent with egalitarian considerations. 1.7 Summary: The study investigates the predictive power of equity theory and strategic concepts within ultimatum bargaining with advance production. This is different from many other experimental studies on non-cooperative bargaining games since usually the resource to be distributed between the subjects is given by the experimenter. Here the pie is produced via joint production effort. This scenario is more general than bargaining without production and we think it is more natural as well. The description of the raw data showed that the production choices are considerably dispersed but nevertheless systematically biased toward the respective player's efficient production level. The distributions of demanded return shares and demanded surplus shares partly replicated findings of other studies, namely a low percentage of high demands and a considerable proportion of equal surplus splits. But they also indicate that advance production compared to no production should be considered an important treatment in studies on ultimatum bargaining. Journal of Economic Literature, 2000

Research and Practice in Multiple Criteria Decision Making Yacov Y. Haimes, Ralph E. Steuer, 2012-12-06. During the past two decades the consideration of multiple objectives in modeling and decision making has grown by leaps and bounds. The nineties in particular have seen the emphasis shift from the dominance of single objective modeling and optimization toward an emphasis on multiple objectives. The proceedings of this Conference epitomize these evolutionary changes and contribute to the important role that the field of multiple criteria decision making (MCDM) now plays in planning, design, operational management and policy decisions. Of special interest are the contributions of MCDM to manufacturing engineering. For example, it has recently been recognized that optimal single objective solutions have often been pursued at the expense of the much broader applicability of designs and solutions that satisfy multiple objectives. In particular, the theme "MCDM and Its Worldwide Role in Risk Based Decision Making" of the XIVth International Conference on Multiple Criteria Decision Making, Charlottesville, Virginia, USA, June 8-12, 1998, represents the growing importance of risk cost-benefit analysis in decision making and in engineering design and manufacturing. In such systems, minimizing the effects of rare and extreme events emerges as an essential objective that risk complements the minimization of the traditional expected value of risk along with the objectives attached to cost and performance. These proceedings include forty-five papers that were presented at the Conference. A variety of techniques have been proposed for solving multiple criteria decision making problems. The emphasis and style of the different techniques largely reflect the fields of expertise of their developers. Modular Pricing of Options Jianwei Zhu, 2013-04-17. From a technical point of view, the celebrated Black and Scholes option pricing formula was originally developed using a separation of variables technique. However, already Merton mentioned in his seminal 1973 paper that it could have been developed by using Fourier transforms as well. Indeed, as is well known nowadays, Fourier transforms are a rather convenient solution technique for many models involving the fundamental partial differential equation of

financial economics It took the community nearly another twenty years to recognize that Fourier transform is even more useful if one applies it to problems in financial economics without seeking an explicit analytical inverse transform Heston 1993 probably was the first to demonstrate how to solve a stochastic volatility option pricing model quasi analytically using the characteristic function of the problem which is nothing else than the Fourier transform of the underlying Arrow Debreu prices and doing the inverse transformation numerically This opened the door for a whole bunch of new closed form solutions in the transformed Fourier space and still is one of the most active research areas in financial economics Project

Scheduling with Time Windows and Scarce Resources Klaus Neumann, Christoph Schwindt, Jürgen Zimmermann, 2013-06-29

A project is a unique undertaking or endeavor to be accomplished that can be divided into individual subtasks or activities each of which requires time and scarce resources for its completion Also there is a desired objective to be attained for example minimization of project duration or of variation of resource utilization or maximization of net present value of the project Moreover there are given precedence relationships among activities prescribing the order in which activities must be carried out Project scheduling in its basic form consists of finding start times for all activities such that prescribed resource and precedence constraints are satisfied and an objective function is optimized Since the concept of a project can be interpreted quite broadly project scheduling problems arise in a great variety of practical situations These include construction work the development and introduction of new products service systems or software packages strategic long term planning in manufacturing and the service sector emergency planning and even the conducting of political campaigns Recently project scheduling has been successfully applied to production and operations management e g make to order production in manufacturing and batch production in process industries Since the late 1950 s network based planning methods for project scheduling problems have been developed cf Elmaghraby 1977 and Moder et al **Money, Inflation, and**

Nonlinear Labor Market Dynamics Michael Neugart, 2012-12-06

Nonlinear Labor Market Dynamics discusses adjustment processes in labor markets. Contrary to linear stochastic approaches, this book is based on a non-linear deterministic framework. It is shown that even textbook-like models of the labor market can generate long-lasting adjustment processes, local instabilities, and chaotic movements once nonlinear relationships and widely accepted adjustment rules are introduced. Thus, labor market dynamics may have an endogenous component that is governed by a nonlinear deterministic core. Of course, all results are tied to the particular models discussed in this book. Nevertheless, these models imply that by incorporating nonlinear relationships, one may arrive at an explanation of labor market behavior where linear stochastic approaches fell. Time series studies for German labor market data support this point of view.

Modern Public Economics Raghbendra Jha, 2002-09-11

Written by Raghbendra Jha, an author with an established reputation, this book fills the gap in literature on this topic and will be a valuable reference for undergraduates in the fields of economics and public finance.

An Economic Theory of Cities Wei-Bin Zhang, 2012-12-06

Over more than two centuries, the development of economic theory has created a wide array of different concepts, theories, and insights. My recent books *Capital and Knowledge* (Zhang, 1999) and *A Theory of International Trade* (Zhang, 2000) show how separate economic theories such as the Marxian economics, the Keynesian economics, the general equilibrium theory, the neoclassical growth theory, and the neoclassical trade theory can be examined within a single theoretical framework. This book is to further expand the framework proposed in the previous studies. This book is a part of my economic theory with endogenous population, capital, knowledge, preferences, sexual division of labor, and consumption institutions, economic structures, and exchange values over time and space. Zhang, 1996a. As an extension of the *Capital and Knowledge*, which is focused on the dynamics of national economies, this book is to construct a theory of urban economies. We are concerned with dynamic relations between division of labor, division of consumption, and determination of prices, structure over space. We examine dynamic interdependence between capital accumulation, knowledge creation and utilization, economic growth, price structures, and urban pattern formation under free competition. The theory is constructed on the basis of a few concepts within a compact framework. The comparative advantage of our theory is that in providing rich insights into the complex of spatial economies, it uses only a few concepts and simplified functional forms and accepts a few assumptions about behavior of consumers, producers, and institutional structures.
