2 Completely Randomized Designs with One Factor

Problem 2.1

Objectives: The objective would be to determine how changing the time-to-rise effects the height of bread dough.

Experimental Unit: The experimental unit in would be the dough in a single loaf pan.

Response or Dependent Variable: The response would be the measured height of the risen dough in a loaf pan.

Independent variables and lurking variables: The independent variable would be the time the dough is allowed to rise, chosen by the experimenter. Lurking variables could be differences in the amount of yeast from loaf to loaf, caused by nonuniform mixing of the ingredients or a temperature gradient in the room causing some loaves to be slightly warmer or cooler than others.

Pilot Test: A pilot test could be run to determine if the rise time could be accurately controlled (by setting multiple timers for example) and whether the loaf height can be measured objectively.

Bias could enter this experiment if factor levels (independent variables) are not randomly assigned to loaves and if lurking variables, such as a temperature gradient, could influence the risen dough height. The ability to measure the risen dough height objectively could also cause problems. Careful attention to a pilot test and randomization could avoid these problems.

Problem 2.2

- a. The experimental unit is a piece of paper combined with the state of the air the helicopter will fly through.
