Interventional Magnetic Resonance Imaging Jörg F. Debatin, Gerhard Adam, 2012-12-06 One of the most amazing and spectacular developments in modern radiology has been the rapid growth and expansion of so called interventional radiology which can also be described as minimally invasive therapy guided by radiological imaging Many applications of this method are now widely in use in different organs particularly in the vascular system Everybody is well aware of the shortcomings and drawbacks of the radiological modalities currently used for guiding minimally invasive procedures Ultrasound although it has the advantage of being absolutely harmless to the patient and the operator cannot be used for many procedures because it does not provide the precise anatomical information needed for a safe performance of these procedures Rontgen rays provide superb anatomical insight to guide delicate manipulations inside the human body but as operations tend to become longer and more complicated the radiation dose for patients as well as for operators is becoming an increasing source of concern It is therefore logical that we should explore the possibilities for interventional radiological procedures provided by the latest imaging modality magnetic resonance imaging taking advantage of the specific physical properties of this method and the absence of ionizing radiation It soon became evident that this new approach represents a tremendous challenge involving the development of new hardware and software new catheters and other material that can be used in a magnetic environment etc

Remote Sensing Digital Image Analysis John A. Richards, 2012-12-06 Possibly the greatest change confronting the practitioner and student of remote sensing in the period since the first edition of this text appeared in 1986 has been the enormous improvement in accessibility to image processing technology Falling hardware and software costs combined with an increase in functionality through the development of extremely versatile user interfaces has meant that even the user unskilled in computing now has immediate and ready access to powerful and flexible means for digital image analysis and enhancement An understanding at algorithmic level of the various methods for image processing has become therefore even more important in the past few years to ensure the full capability of digital image processing is utilised This period has also been a busy one in relation to digital data supply Several nations have become satellite data gatherers and providers using both optical and microwave technology Practitioners and researchers are now faced therefore with the need to be able to process imagery from several sensors together with other forms of spatial data This has been driven to an extent by developments in Geographic Information Systems GIS which in turn have led to the appearance of newer image processing procedures as adjuncts to more traditional approaches
