Event Based Programming Taking Events To The Limit:

Event-Based Programming Ted Faison, 2014-11-16 This book shows how to develop software based on parts that interact primarily through an event mechanism The book demonstrates the use of events in all sorts of situations to solve recurring development problems without incurring coupling A novel form of software diagram is introduced called Signal Wiring Diagram These diagrams are similar to the circuit diagrams used by hardware designers A series of case studies concludes the book bringing all the next concepts introduced together Source code is provided in both C and VB NET

Event-Based Programming Ted Faison, 2006-12-06 Languages like C VB NET and Delphi include built in support for events and these events become very powerful when they connect the objects and components of a system Events make it possible for such parts to interact without any coupling And the resulting parts can be developed and tested individually which keeps the code clean and simple Component based development CBD is an extension of object oriented programming CBD does away with the language and vendor specific limitations of OOP makes software reuse more practical and accelerates the development process Event based programming is the next logical step in CBD and makes components more reusable due to their decoupled nature But event based systems are easier to develop which means they are cheaper and more reliable than traditional OOP or CBD systems This book teaches you how to develop software based on parts that interact primarily through an event mechanism You will learn how to use events in many different situations to solve recurring development problems without coupling The book introduces Signal Wiring Diagram a novel form of software diagram similar to the circuit diagrams used by hardware designers The book concludes with a series of case studies incorporating all featured concepts In a nutshell you will want to pick up a copy of this book because it How to use an event based paradigm to reduce or completely eliminate coupling between classes and components Describes components including coordinators workers builders binders and routers Three complete case studies that model concepts being used to design small medium and large systems

The Concept of a Real-Time Enterprise in Manufacturing Daniel Metz, 2013-10-01 Enterprises have to react instantly to changing market conditions and disturbances that occur during execution of value creation processes Depending upon the processes context the goal is to significantly reduce lead times reaction times and time to market among others The vision of a real time enterprise RTE which is able to sense and analyze events from internal and external sources and perform adequate reactions has been envisaged by manufacturing enterprises Daniel Metz presents a framework based on EDA and CEP towards the realization of RTE in manufacturing The framework closes the vertical integration gap and further establishes feedback in near real time among enterprise levels As such the framework provides a holistic and closed loop control of manufacturing processes and encompasses results and insights from management engineering and computer science The framework has been implemented for a small and medium sized foundry in Germany The developed control approach has led to a significant increase in manufacturing processes efficiency i.e. performance quality and availability
