Electromagnetic Compatibility in Railways Ade Ogunsola, Andrea Mariscotti, 2012-08-14 A railway is a complex distributed engineering system the construction of a new railway or the modernisation of a existing one requires a deep understanding of the constitutive components and their interaction inside the system itself and towards the outside world The former covers the various subsystems featuring a complex mix of high power sources sensitive safety critical systems intentional transmitters etc and their interaction including the specific functions and their relevance to safety The latter represents all the additional possible external victims and sources of electromagnetic interaction EMC thus starts from a comprehension of the emissions and immunity characteristics and the interactions between sources and victims with a strong relationship to electromagnetics and to system modeling On the other hand the said functions are achieved and preserved and their relevance for safety is adequately handled if the related requirements are well posed and managed throughout the process from the beginning The link is represented by standards and their correct application as a support to analysis testing and demonstration

Handbook of RAMS in Railway Systems Qamar Mahboob, Enrico Zio, 2018-03-14 The Handbook of RAMS in Railway Systems Theory and Practice addresses the complexity in today s railway systems which use computers and

Pelczar,2012-03-23 The Mobile VISMA is a power electronics device for V2G applications which behaves like an electromechanical synchronous machine and offers the same beneficial properties to the power network increasing inertia in the system stabilizing the grid voltage and providing a short circuit current in case of grid faults The VISMA performs a real time simulation of a synchronous machine and calculates the phase currents that an electromagnetic synchronous machine would produce under the same local grid conditions These currents are fed into the grid using a current controlled inverter In this dissertation the requirements for a machine model suitable for the VISMA are set and a mathematical model suitable for use in the VISMA algorithm is found and implemented A new hardware architecture for the Mobile VISMA based on microcontroller and FPGA technologies is presented The new architecture allows the reduction of the size and cost of the

VISMA making it suitable for installation in electric vehicles A simulation model of the inverter hardware and hysteresis current controller is created and validated by experiment The verified hardware model is then used to design a new type of PWM based current controller The performance of the hysteresis and PWM based current controllers is evaluated and compared Finally the behavior of the VISMA during power network faults is examined and it is shown that the VISMA inverter hardware and current controllers are capable of fault ride through and can support the power network during faults
