

SUPERIMPOSED TIMING SIGNAL—Circuit applies known fixed frequency (in range of 2 to 200 MHz) from crystal oscillator to horizontal sweep of crt being used for displaying burst data, for accurate measurement of duration, amplitude, and steepness of pulse traces. Transformer used has several different cores, to permit changing oscillator without having to change tuned i-f transformer. Value of R_1 is chosen to protect transformer from maximum 20-W power of oscillator.—P. Allen, Multi-Core Transformers Broad Bandwidth, *Electronic Design*, Feb. 2, 1964, p. 20-22.

CODED REFERENCE WAVEFORM—Pulse generator connected to sync input of crr can be driven either by master clock of digital system or by any external signal source. If period in seconds of reference waveform is known, then delay in pulse on crr trace can

be measured directly by projecting leading edge of pulse down to reference waveform and reading delay in increments of clock (in μ s if clock is 1 MHz). Reference waveform, as generated by IC units shown, has long pulse marking beginning of each period.

Following four bit positions determine most significant digit in hexadecimal code. Two more four-bit decimal codes follow.—J. L. Nichols, Reference Waveform Adds to Scope's Measuring Capability, *Electronic Design*, Dec. 22, 1969, p. 77-78.
